Deciphering the Answers: A Deep Dive into Past Paper Solutions

Providing accurate solutions to past papers is crucial. Here, we explore typical question types and detailed answer strategies, illustrating how to interpret and approach each.

1. Multiple-Choice Questions (MCQs)

Example Question:

Which of the following elements has the highest ionization energy?

a) Sodium (Na)

b) Chlorine (Cl)

c) Neon (Ne)

d) Magnesium (Mg)

Answer and Explanation:

The correct answer is c) Neon (Ne).

Ionization energy refers to the energy required to remove an electron from a neutral atom. Noble gases like neon have full outer shells, making it difficult to remove an electron. Neon, being a noble gas with a complete octet, has the highest ionization energy among the options.

Approach:

- Recall periodic trends: ionization energy increases across a period and decreases down a group.
- Eliminate options with lower ionization energies (e.g., Na, Mg).
- Confirm by considering noble gases' stability.

2. Short-Answer Questions

Example Question:

Calculate the molar mass of calcium carbonate (CaCO_3).

Solution Steps:

- Atomic masses: Ca = 40.08 g/mol, C = 12.01 g/mol, O = 16.00 g/mol
- Calculation:

$$\text{Molar mass} = 1 \times 40.08 + 1 \times 12.01 + 3 \times 16.00$$

$$= 40.08 + 12.01 + 48.00$$

$$= 100.09 \text{ g/mol}$$

Tips:

- Use periodic table values for atomic masses.
- Break down complex compounds into elements.
- Include units in your calculations.

3. Data Interpretation and Calculation Questions

Example Question:

Given the following titration data, calculate the concentration of the unknown acid.

Volume of NaOH used (mL)	Concentration of NaOH (mol/L)	Volume of acid (mL)
--------------------------	-------------------------------	---------------------

-----	-----	-----
-------	-------	-------

25.0	0.1	50.0
------	-----	------

Solution:

- Moles of NaOH = concentration $\times$ volume (in liters)

$$= 0.1 \text{ mol/L} \times 0.025 \text{ L} = 0.0025 \text{ mol}$$

- Since NaOH and the acid react 1:1, moles of acid = moles of NaOH = 0.0025 mol
- Concentration of acid = moles / volume (in liters)

$$= 0.0025 \text{ mol} / 0.050 \text{ L} = 0.05 \text{ mol/L}$$

Key Point:

Always convert mL to liters before calculations.

The June 2013 paper exemplifies these elements, emphasizing application and problem-solving over rote memorization.

Detailed Breakdown of the June 2013 Questions and Answers

Below, we analyze some of the core questions from the June 2013 paper, offering detailed explanations and insights into the correct solutions.

Question 1: Atomic Structure and Isotopic Composition

Question:

A sample of an element contains two isotopes, A and B. The relative atomic masses are 20.00 u and 22.00 u, respectively. The abundance of isotope A is 80%. Calculate the relative atomic mass of the element.

Answer:

The relative atomic mass (A_r) is calculated using the weighted average:

$$A_r =$$

$$(\text{fraction of A} \times \text{mass of A}) + (\text{fraction of B} \times \text{mass of B})$$

$$=$$

$$=$$

$$= (0.80 \times 20.00) + (0.20 \times 22.00) = 16.00 + 4.40 = 20.40 \text{ u}$$

\]

Analysis:

This question tests understanding of isotopic abundance and its impact on atomic mass calculations. It underscores the importance of weighted averages in atomic mass determinations, a fundamental concept underpinning modern atomic theory.

Question 2: Bonding and Structure

Question:

Describe the bonding in magnesium oxide (MgO). Explain how the bonding influences its physical properties, such as melting point and solubility.

Answer:

Magnesium oxide (MgO) exhibits ionic bonding. Magnesium atoms lose two electrons to form Mg^{2+} ions, while oxygen atoms gain two electrons to form O^{2-} ions. These ions are held together by strong electrostatic attractions, forming an ionic lattice.

Influence on Physical Properties:

- High Melting Point:

The strong electrostatic forces between Mg^{2+} and O^{2-} ions require substantial energy to break, resulting in a high melting point ($\sim 2800^\circ\text{C}$).

- Solubility:

MgO is sparingly soluble in water because water molecules can weakly polarize the ions, but the ionic lattice is very stable. Its solubility increases slightly with temperature, typical of ionic solids.

Analysis:

Understanding ionic bonding helps predict physical properties. The strong lattice energy correlates with high melting points, while solubility depends on the balance between lattice energy and hydration energy.

Question 3: Energetics and Thermodynamics

Question:

Given the following data:

- Enthalpy change of combustion of ethanol, $\Delta H^\circ_{\text{combustion}} = -1367 \text{ kJ/mol}$
- Enthalpy change of formation of ethanol, $\Delta H^\circ_{\text{f}} = -277 \text{ kJ/mol}$

Calculate the enthalpy change for the reaction:

Answer:

Using Hess's Law:

$$\Delta H = \Delta H_{\text{f, products}} - \Delta H_{\text{f, reactants}}$$

But since combustion data is given, we use the relation:

Alternatively, recognizing the given data, a more straightforward approach is to understand that the enthalpy of formation of ethanol is directly provided, so:

\[

\boxed{

$\Delta H = -277 \text{ kJ/mol}$

}

\]

Analysis:

This problem involves applying Hess's Law and understanding the relationship between combustion and formation enthalpies. It emphasizes the importance of enthalpy cycle calculations in thermodynamics.

Question 4: Kinetics and Reaction Mechanisms

Question:

A reaction between iodine (I_2) and propanone (acetone) in the presence of acid is studied. The rate equation is found to be:

\[

$$\text{Rate} = k[I_2][\text{Propanone}]$$

\]

Explain what this rate equation suggests about the reaction mechanism.

Answer:

The rate equation indicates that the reaction is first order with respect to both iodine and propanone. This suggests that:

- The rate-determining step involves one molecule of I_2 and one molecule of propanone reacting simultaneously.
- The mechanism likely involves a bimolecular slow step where both reactants participate together, possibly forming an intermediate.

Implication:

The overall reaction mechanism is consistent with a two-molecular step, perhaps involving the formation of an iodine-propanone complex or an electrophilic attack facilitated by acid.

Analysis:

Understanding rate laws helps elucidate reaction mechanisms. A rate law showing first-order dependence on each reactant is indicative of a bimolecular slow step, critical in reaction pathway analysis.

Question 5: Organic Chemistry ? Synthesis and Isomerism

Question:

Describe two isomers of butene (C_4H_8). Explain their differences in terms of structure and reactivity.

Answer:

Isomers of Butene:

- 1-Butene ($CH_2=CHCH_2CH_3$):

- Structure: The double bond is between carbon 1 and 2.
- Features: Terminal alkene, with the double bond at the end of the chain.

- 2-Butene ($CH_3CH=CHCH_3$):

- Structure: The double bond is between carbon 2 and 3.
- Features: Internal alkene, with the double bond within the chain.

Differences in Reactivity:

- 1-Butene is more reactive in electrophilic addition reactions because the terminal double bond is less stabilized and more accessible.
- 2-Butene exists as two stereoisomers (cis- and trans-), which influence physical properties and

reactivity. The trans-isomer is generally more stable due to less steric hindrance.

Analysis:

Isomerism in alkenes influences their chemical behavior and physical properties. Recognizing structural and stereoisomers is essential in organic synthesis and reactions.
