## Car Park Using Ladder Logic

### Car park using ladder logic

Designing an automated car parking system using ladder logic is a practical application of programmable logic controllers (PLCs) in modern automation. Such systems aim to efficiently manage vehicle entry, parking, and exit processes, reducing human intervention, improving safety, and optimizing space utilization. Ladder logic, with its visual, relay-based format, is well-suited for implementing control sequences in these systems, providing clarity and reliability. In this article, we explore the fundamental concepts, components, and design considerations involved in developing a car park system using ladder logic.

## Introduction to Car Park Automation

Automated car parking systems have become increasingly popular in urban environments where space is limited. These systems range from simple barrier gate controls to complex multi-level automated parking structures. The core objectives are to:

- Control vehicle entry and exit
- Allocate parking slots efficiently
- Monitor occupancy status
- Ensure safety and security

Implementing these objectives requires a combination of sensors, actuators, and logic control, often orchestrated through PLCs programmed with ladder logic.

## Components of a Car Park System Using Ladder Logic

A typical automated car parking system comprises several key components:

### Sensors

- Vehicle Detection Sensors: Usually inductive loops, infrared sensors, or photoelectric sensors to detect vehicle presence at entry/exit points.
- Occupancy Sensors: Sensors within parking slots to detect whether a slot is free or occupied.
- Barrier Sensors: Limit switches or proximity sensors to confirm barrier gate positions.

### Actuators

- Barrier Gates: Motorized gates that open or close based on control signals.
- Display Units: Indicate parking availability or instructions to drivers.
- Lights: Signal statuses such as entry allowed, full parking, or exit.

## Control Devices

- PLC: The core controller that processes sensor inputs and controls actuators.
- Human-Machine Interface (HMI): Optional interface for monitoring and manual control.

## Designing the Control Logic Using Ladder Logic

Ladder logic programming is a graphical programming language resembling relay circuits, making it intuitive for control system design.

### Basic Control Sequence

The typical sequence in a car park system includes:

- Vehicle detection at the entry point.
- Checking if parking is available.
- Opening the barrier for entry.
- Updating parking slot occupancy.
- Managing vehicle exit.
- Updating occupancy status and closing barriers.

## Step-by-Step Ladder Logic Development

### 1. Vehicle Entry Detection

- When a vehicle arrives at the entry sensor, a contact (Sensor\_In) is energized.
- Check if parking is not full before allowing entry.

### 2. Parking Full Detection

- Use a counter or occupancy variable to track the number of parked vehicles.
- If parking is full, activate an indicator (e.g., Full Light) and prevent barrier opening.

### 3. Barrier Gate Control

- When Vehicle\_In is detected and parking is available, energize the barrier motor coil to open the

gate.

- After the vehicle passes, sensors confirm vehicle has entered, then close the barrier.

#### 4. Update Parking Slot Occupancy

- Detect which slot the vehicle occupies via sensors.
- Mark that slot as occupied in the control logic.

#### 5. Vehicle Exit Management

- Detect vehicle at exit sensor.
- Free the associated parking slot.
- Open the exit barrier to allow vehicle to leave.
- Close the barrier after vehicle passes.

#### 6. Parking Slot Management

- Use a set of sensors for each parking slot.
- Maintain a data structure (e.g., counters) to track free and occupied slots.

### Sample Ladder Logic Concepts for Car Park System

Below are key ladder logic elements and their functions:

- **Contacts:** Represent sensor inputs (e.g., Vehicle\_Detected, Slot\_Occupied).
- **Coils:** Activate actuators like barriers, lights, or indicators.
- **Timers:** Control delays such as barrier opening/closing durations.
- **Counters:** Keep track of the number of vehicles parked.

### Implementing Parking Slot Management

Efficient management of parking slots is vital for system accuracy.

#### Slot Occupancy Detection

- Use proximity sensors or limit switches in each parking slot.

- When a vehicle enters or leaves a slot, sensors update the slot status.

## Data Handling in Ladder Logic

- Use internal bits or registers to represent each slot's status.
- For example, a bit (Slot1\_Occupied) can be set or reset based on sensor inputs.

## Automated Allocation

- When a vehicle arrives, the system searches for the first available slot.
- Assigns the slot and updates its status accordingly.

## Safety and Fail-Safe Features

Safety considerations are critical in automated parking systems.

### Emergency Stop

- Implement emergency stop buttons that immediately halt all operations.

### Sensor Failures

- Use redundancy or periodic diagnostics to detect sensor faults.
- Default to safe states if a fault is detected.

### Barrier Safety

- Incorporate sensors to detect obstructions under barriers.
- Stop barrier movement if an obstacle is detected.

## Example Ladder Logic Diagram Overview

While a comprehensive ladder diagram is extensive, the following summarizes key logic blocks:

- Entry Logic Block:

- Detect vehicle at entry sensor.
  - Check parking capacity.
  - Open barrier if space available.
  - Update slot occupancy.
- 
- Exit Logic Block:
  - Detect vehicle at exit sensor.
  - Free occupied slot.
  - Open exit barrier.
  - Update slot status.
- 
- Parking Capacity Control:
  - Maintain a counter that increments on entry and decrements on exit.
  - Prevent entry when counter reaches maximum capacity.
- 
- Indicators and Alarms:
  - Light indicators for full parking, entry allowed, or exit permitted.
