Fundamental Formulas in Elementary Statistics

Having a solid grasp of key formulas is crucial for data analysis, hypothesis testing, and descriptive statistics. Below are the primary formulas every beginner should know.

- Measures of Central Tendency

- Sample Mean ($\bar{x}$):

$$\bar{x} = (\Sigma x_i) / n$$

Sum of all data points divided by the number of data points.

- Population Mean (μ):

$$\mu = (\Sigma X_i) / N$$

Sum of all population data points divided by total population size.

$$z = (X - \mu) / \sigma$$

Standardized score indicating how many standard deviations a data point X is from the mean.

Descriptive Statistics: Summarizing Data

Descriptive statistics involves summarizing data with key measures. Here's how to compute and interpret the main descriptive statistics:

Measures of Central Tendency

- Purpose: Identify the "center" of the data distribution.
- Key formulas: Mean, median, mode.
- Use cases: When data is symmetric, the mean is often preferred; median is better for skewed data.

Measures of Variability

- Purpose: Understand the spread of data.
- Key formulas: Variance and standard deviation.
- Use cases: Larger standard deviation indicates more variability.

Measures of Position

- Purpose: Locate specific data points within the distribution.
- Key formulas: Quartiles, percentiles, z-scores.
- Use cases: Identify outliers or specific data points.

Inferential Statistics: Making Predictions and Decisions

While elementary statistics primarily focus on descriptive measures, understanding basic inferential formulas is also beneficial.

- Confidence Intervals

Estimate the range where a population parameter lies with a certain confidence level.

- For the mean (when σ is known):

$$CI = \bar{x} \pm Z(\sigma/\sqrt{n})$$

Z is the z-score corresponding to the confidence level (e.g., 1.96 for 95%).

- For the mean (when σ is unknown):

$$CI = \bar{x} \pm t(s/\sqrt{n})$$

t is the t-score for the desired confidence level and degrees of freedom (n-1).

- Hypothesis Testing

Testing assumptions about population parameters.

- Test statistic for a mean:

$$t = (\bar{x} - \mu) / (s/\sqrt{n})$$

Compare t to critical t-value to decide whether to reject the null hypothesis.

Practical Tips for Using the Cheat Sheet
