- **Mantle:** A thick, semi-solid layer that convects slowly, driving plate movement.
- **Core:** Composed of an outer liquid core and inner solid core, primarily made of iron and nickel.

3. Rock Cycle

The rock cycle explains how rocks transform between three main types:

- **Igneous Rocks:** Formed from cooled magma or lava.
- **Sedimentary Rocks:** Created from erosion, compaction, and cementation of sediments.
- **Metamorphic Rocks:** Result from existing rocks transformed by heat and pressure.

Major Processes Shaping the Earth

Several natural processes are fundamental to the ongoing development and alteration of Earth's surface and interior:

1. Volcanism and Eruption

Volcanoes form when magma from the Earth's interior breaches the surface, creating landforms and releasing gases that influence atmospheric composition.

2. Earthquakes

Sudden movements along faults release energy, causing shaking and sometimes catastrophic damage. They are closely linked to plate tectonic activity.

3. Erosion and Deposition

Erosion wears down rocks and landforms via wind, water, and ice, while deposition builds new landforms such as deltas and alluvial fans.

4. Weathering

The breakdown of rocks into smaller particles through physical, chemical, and biological processes contributes to soil formation and landscape change.

5. Climate and Atmospheric Dynamics

Climate patterns influence weather, ocean currents, and the distribution of ecosystems across the globe.
