At its core, night is the period of darkness that occurs when the Sun is below the horizon. It is a consequence of the Earth's rotation on its axis, which causes different parts of the planet to move into and out of the Sun's light. The duration and appearance of night vary depending on geographical location, time of year, and atmospheric conditions.

#### Biological Impacts of Night

Many organisms have adapted to the cycle of night and day, leading to behaviors and physiological changes aligned with darkness:

- **Circadian Rhythms:** Internal biological clocks that regulate sleep-wake cycles, hormone production, and other vital functions.
- **Nocturnal Animals:** Species such as owls, bats, and certain insects are active during the night, exploiting the cover of darkness for hunting, mating, and other activities.
