What Is the Marshall and Swift Equipment Cost Index?

The **Marshall and Swift Equipment Cost Index** (M&S Index) is a numerical value that tracks the changes in equipment costs over time, typically on a monthly basis. Developed by Marshall & Swift/Boeckh, a division of CoreLogic, this index has been a trusted benchmark in the industry for decades. It helps estimate the current costs of equipment based on historical data, adjusting for inflation and market fluctuations.

Historical Background and Development

The M&S Index was first introduced in the early 20th century, evolving over time to incorporate more comprehensive data sources and refined calculation methods. Its primary purpose was to assist engineers and project managers in accurately estimating equipment costs during project planning stages, especially when detailed vendor quotes are unavailable.

The Composition of the Index

The index considers a broad range of equipment types used in industrial, commercial, and infrastructure projects. It includes machinery such as:

- Process equipment
- Mechanical systems
- Electrical equipment

- Construction machinery
- Industrial tools

The index is calculated based on a weighted average of costs from various sectors, reflecting the overall trend in equipment prices.

How Is the Marshall and Swift Equipment Cost Index Calculated?

Understanding the calculation methodology of the M&S Index can provide insights into its reliability and applicability.

Data Collection Sources

The index draws data from multiple sources, including:

- Equipment vendors and manufacturers
- Industrial equipment catalogs
- Market surveys
- Historical price data

This comprehensive data collection ensures that the index accurately reflects current market conditions.

Calculation Methodology

While the exact proprietary formula used by Marshall & Swift is not publicly disclosed, the general approach involves:

- Gathering equipment cost data for a base year.
- Adjusting these costs periodically using price trends observed in the data sources.
- Applying weighting factors to different equipment categories based on their typical usage in industry sectors.
- Calculating a composite index value representing overall equipment cost trends.

The resulting index values are then indexed to a base year (commonly 1913 or 1926) to facilitate comparison over time.
