Vector Algebra and Operations

Vector algebra forms the backbone of vector analysis. The operations and properties are fundamental to manipulating and understanding vector fields.

- **Vector Addition:** Geometrically, adding vectors involves placing the tail of one vector at the head of another, resulting in the resultant vector. Algebraically, it involves summing respective components

- **Scalar (Dot) Product:** Given vectors $\mathbf{A}$ and $\mathbf{B}$, their dot product is $\mathbf{A} \cdot \mathbf{B} = |\mathbf{A}||\mathbf{B}|\cos\theta$. It yields a scalar and is used to find angles and projections.

- **Vector (Cross) Product:** $\mathbf{A} \times \mathbf{B}$ produces a vector perpendicular to both $\mathbf{A}$ and $\mathbf{B}$. Magnitude equals $|\mathbf{A}||\mathbf{B}|\sin\theta$, and direction follows the right-hand rule.

Differentiation of Vector Functions

This section deals with how vectors change with respect to a parameter, typically time or position.

- **Velocity Vector:** $\mathbf{v} = \frac{d\mathbf{r}}{dt}$, representing the rate of change of position

- **Acceleration Vector:** $\mathbf{a} = \frac{d\mathbf{v}}{dt}$, indicating how velocity changes over time

- **Chain Rule Application:** Used when vectors depend on multiple variables or parameters

Line, Surface, and Volume Integrals

These integrals generalize the concept of summing quantities over geometrical entities.

- **Line Integrals:** Essential for calculating work done by a force along a path
- **Surface Integrals:** Used to compute flux through a surface, vital in electromagnetism
- **Volume Integrals:** Applied in mass, charge, and energy calculations over three-dimensional regions

Theorems of Vector Calculus

These theorems establish relationships between different types of integrals and are fundamental in simplifying complex calculations.

- **Gradient:** Operator that produces a vector field pointing in the direction of maximum increase
- **Divergence:** Scalar measure of a vector field's tendency to originate from or converge into a point
- **Curl:** Vector measure of the rotation or swirling strength of a field
- **Divergence Theorem:** Converts a volume integral of divergence to a flux integral over the boundary surface
- **Stokes' Theorem:** Relates the surface integral of curl to the line integral around the boundary
- **Green's Theorem:** Connects a double integral over a plane region to a line integral around its boundary
