Introduction to Optimization in Operations Research

Operations research (OR) is a discipline dedicated to the application of analytical methods to aid decision-making. Within OR, optimization serves as the core technique for finding the most effective solutions based on well-defined objectives. Whether the goal is minimizing costs, maximizing profits, or balancing multiple criteria, optimization provides a structured approach to tackle these problems systematically.

Optimization problems in OR are typically modeled mathematically, involving decision variables, an objective function, and constraints. The goal is to determine the values of decision variables that optimize (maximize or minimize) the objective while satisfying all constraints. This modeling process requires a clear understanding of the problem context, data, and desired outcomes.

Types of Optimization Problems

Understanding the various types of optimization problems is crucial for selecting appropriate methods. They are generally classified based on the nature of the variables, the objective function, and constraints.
