Sample Questions and Their Analytical Breakdown

Example 1: Simple Interest Calculation

Question:

If you deposit \$2,000 into a savings account with an annual simple interest rate of 3%, how much interest will you earn after 4 years?

Answer:

Interest = Principal $\times$ Rate $\times$ Time

Interest = \$2,000 $\times$ 0.03 $\times$ 4 = \$240

Analysis:

This question tests the student's understanding of the simple interest formula. The straightforward calculation reinforces the importance of understanding rate, time, and principal relationships in financial planning.

Example 2: Compound Interest Scenario

Question:

A \$1,500 investment earns 5% annual interest compounded quarterly. What will be the value of the investment after 3 years?

Answer:

$$\text{Future Value} = \text{Principal} \times (1 + r/n)^{(n \times t)}$$

Where:

$$r = \text{annual interest rate} = 0.05$$

$$n = \text{number of compounding periods per year} = 4$$

$$t = \text{years} = 3$$

Calculation:

$$FV = \$1,500 \times (1 + 0.05/4)^{(4 \times 3)}$$

$$FV = \$1,500 \times (1 + 0.0125)^{12}$$

$$FV = \$1,500 \times (1.0125)^{12} = \$1,500 \times 1.1616 = \$1,742.40$$

Analysis:

This problem introduces students to compound interest and the effect of compounding frequency. Understanding this concept is crucial for evaluating investment growth and loan costs.

Importance of Accurate and Detailed Answer Explanations

Apex Learning's strength lies in its detailed answer explanations, which serve several educational

purposes:

- Encouraging Critical Thinking: Prompting students to consider alternative approaches and verify their solutions.

For example, in interest calculation questions, answers often include a step-by-step breakdown, formula derivation, and contextual interpretation. This comprehensive explanation fosters deeper understanding and retention.

Sample Explanation for Compound Interest Calculation:

The key to understanding compound interest is recognizing that each period's interest is calculated on the accumulated amount from previous periods. Here, quarterly compounding means the interest rate per quarter is 1.25%. By raising $(1 + 0.0125)$ to the power of 12 (quarters over 3 years), we account for the effect of compounding frequency. The resulting future value reflects how your investment grows faster with more frequent compounding.
