- Finding the area of triangles.
- Determining orthocenters.
- Understanding the properties of right triangles.

Key points about altitudes:

- Every triangle has three altitudes.
- The point where all three altitudes intersect is called the orthocenter.
- In right triangles, the orthocenter is located at the vertex of the right angle.

What Are Medians in Triangles?

Medians are segments connecting a vertex to the midpoint of the opposite side. They are significant because:

- They divide the triangle into two smaller triangles of equal area.
- Their intersection point, called the centroid, is the triangle's center of mass.

Key points about medians:

- Each triangle has three medians.
- The centroid divides each median into two segments with a 2:1 ratio.
- The centroid is always located inside the triangle.

What Are Angle Bisectors?

An angle bisector is a segment that divides an angle into two equal parts, extending from the vertex to the opposite side.

Key points about angle bisectors:

- Every angle has an angle bisector.
- The point where all three angle bisectors intersect is called the incenter.
- The incenter is equidistant from all sides of the triangle, making it the center of the inscribed circle.
