Introduction to Signals and Systems

Signals and systems form the backbone of modern electrical engineering, telecommunications, control systems, and signal processing. Understanding their fundamental concepts is crucial for analyzing and designing systems that process information.

What Are Signals?

Signals are functions that convey information about phenomena, usually varying over time, space, or other parameters. They can be classified based on various criteria:

- Continuous-time signals: Defined for every instant of time (e.g., analog audio signals).
- Discrete-time signals: Defined only at discrete time intervals (e.g., digital signals).
- Deterministic signals: Known precisely for all time.
- Random signals: Have some inherent randomness, characterized statistically.

What Are Systems?

A system is a device or process that produces an output signal in response to an input signal. Systems can be characterized by their properties and mathematical models.

- Linear systems: Systems that satisfy the principles of superposition.
- Time-invariant systems: Systems whose behavior does not change over time.
- Causal systems: Systems where the output depends only on current or past inputs.
- Stable systems: Systems whose outputs remain bounded for bounded inputs.

Detailed Breakdown of the Solution Approach

Step 1: Understanding Signal Types and Their Properties

The solution emphasizes the importance of correctly identifying the type of signals involved in a problem, whether continuous or discrete, deterministic or random. It provides strategies for analyzing their properties, such as symmetry, periodicity, and energy.

Step 2: Applying System Properties for Simplification

By leveraging properties like linearity and time invariance, the solution guides students through simplifying complex system responses. For example, breaking down a complicated input into simpler components can make convolution calculations more manageable.

Step 3: Utilizing Transform Techniques

Transform methods are central to solving differential and integral equations associated with systems:

- Fourier Transform: Ideal for analyzing frequency response.

- Z-transform: Primarily used for discrete-time systems.

The solution emphasizes choosing the appropriate transform based on the problem context and demonstrates how to leverage inverse transforms to find time-domain responses.

Step 4: Convolution and System Response

The convolution integral (for continuous-time systems) and convolution sum (for discrete-time systems) are fundamental in determining output signals:

- Convolution integral:

\[

$$y(t) = (x * h)(t) = \int_{-\infty}^{\infty} x(\tau) h(t - \tau) d\tau$$

\]

- Convolution sum:

\[

$$y[n] = (x * h)[n] = \sum_{k=-\infty}^{\infty} x[k] h[n - k]$$

\]

The solution demonstrates step-by-step methods for calculating convolutions efficiently.

Step 5: Solving Practical Problems

The solution provides worked examples involving:

- Finding system impulse responses
- Computing frequency responses

- Determining system causality

These examples are tailored to reflect typical exam questions and real-world applications.

Common Problems and How to Solve Them Using the Solution

Problem 1: Determining System Stability

Question: Given a system with a transfer function $H(s) = \frac{1}{s+2}$, determine if the system is stable.

Solution Approach:

- Check the poles of $H(s)$.
- Since the pole is at $s = -2$, which has a negative real part, the system is stable.

Problem 2: Computing the Output of a Linear Time-Invariant System

Question: For an input $x(t) = e^{2t}u(t)$, find the output $y(t)$ of a system with impulse response $h(t) = e^{-t}u(t)$.

Solution Approach:

- Use convolution:

$y(t) = (x * h)(t) = \int_{-\infty}^{\infty} x(\tau) h(t - \tau) d\tau$

$$y(t) = (x * h)(t) = \int_{-\infty}^{\infty} e^{2\tau} u(\tau) e^{-(t-\tau)} u(t-\tau) d\tau$$

\]

- Solve the integral to find the response.

Problem 3: Frequency Response of a System

Question: Find the magnitude and phase of the frequency response $H(j\omega) = \frac{1}{j\omega + 1}$.

Solution Approach:

- Express $H(j\omega)$ in magnitude and phase form:

\[

$$|H(j\omega)| = \frac{1}{\sqrt{\omega^2 + 1}}$$

\]

\[

$$\angle H(j\omega) = -\arctan(\omega)$$

\]

Step-by-Step Breakdown of a Typical Solution

Let's examine how Stuller's solutions approach a common problem: Determine the response of a linear time-invariant (LTI) system to a given input signal.

Example Problem: Find the output $y(t)$ of an LTI system with impulse response $h(t) = e^{-2t}u(t)$ to the input $x(t) = \cos(4t)u(t)$.

Step 1: Understand the Problem

- Recognize the system is LTI.
- Input: $x(t)$.
- Impulse response: $h(t)$.

The goal is to find the output $y(t)$.

Step 2: Recall the Convolution Integral

For LTI systems,

$$y(t) = (x * h)(t) = \int_{-\infty}^{\infty} x(\tau) h(t - \tau) d\tau$$

Step 3: Use Fourier Transform or Frequency Response

Given the sinusoidal input, it's often easier to work in the frequency domain:

- Determine the system's frequency response $H(\omega)$.

- Find the Fourier Transform of $x(t)$: $X(\omega)$.
- Calculate $Y(\omega) = H(\omega) X(\omega)$.
- Inverse Fourier Transform to find $y(t)$.

Step 4: Find $H(\omega)$

- The Fourier Transform of $h(t) = e^{-2t} u(t)$:

$$H(\omega) = \int_{-\infty}^{\infty} e^{-2t} e^{-j\omega t} dt = \frac{1}{2 + j\omega}$$

Step 5: Find $X(\omega)$

- Fourier Transform of $x(t) = \cos(4t) u(t)$:

$$X(\omega) = \pi [\delta(\omega - 4) + \delta(\omega + 4)]$$

(Note: Since $x(t)$ is multiplied by $u(t)$, its Fourier Transform is a pair of delta functions at ± 4 .)

Step 6: Compute $Y(\omega)$

- Multiply $H(\omega)$ with $X(\omega)$:

$$Y(\omega) = H(\omega) X(\omega) = \pi [\delta(\omega - 4) H(\omega) + \delta(\omega + 4) H(\omega)]$$

- Evaluate at $\omega = \pm 4$:

$$H(4) = \frac{1}{2 + j4}$$

$$H(-4) = \frac{1}{2 - j4}$$

Step 7: Find $y(t)$ via Inverse Fourier Transform

- The output is:

$$y(t) = \frac{1}{2\pi} \int_{-\infty}^{\infty} Y(\omega) e^{j\omega t} d\omega$$

- Substituting $Y(\omega)$:

$$y(t) = \frac{1}{2} \left[H(4) e^{j4t} + H(-4) e^{-j4t} \right]$$

- Simplify:

$$y(t) = \frac{1}{2} \left[\frac{e^{j4t}}{2 + j4} + \frac{e^{-j4t}}{2 - j4} \right]$$

- Rationalize denominators and express as real functions:

$$y(t) = \text{Re} \left\{ \frac{e^{j4t}}{2 + j4} \right\} \times 2$$

- Calculating the magnitude and phase to write in sinusoidal form.

Step 8: Final Expression and Interpretation

The resulting $y(t)$ will be a sinusoid at frequency 4 rad/sec, scaled and phase-shifted according to the system's transfer function.
