Detailed Review and Answers to Chapter 12 Questions

Below, we delve into detailed explanations and solutions for typical questions from Chapter 12 to reinforce your understanding.

Measuring Arcs and Angles

- **Question:** How is the measure of an inscribed angle related to the intercepted arc?
- **Answer:** The measure of an inscribed angle is always half the measure of its intercepted arc. Mathematically, if an inscribed angle intercepts an arc of measure m , then the angle's measure is $m/2$.
- **Example:** If an inscribed angle intercepts an arc measuring 80° , the angle measures 40° .
- **Question:** How do you find the measure of a minor arc if the measure of the central angle is

known?

- **Answer:** The measure of the minor arc is equal to the measure of its central angle. For example, if the central angle measures 100° , then the minor arc also measures 100° .

Properties of Chords and Their Segments

- **Question:** When two chords intersect inside a circle, how do you find the segments of the chords?

- **Answer:** The segments of intersecting chords satisfy the Power of a Point theorem: The product of the segments of one chord equals the product of the segments of the other chord. If chord AB intersects chord CD at point E, then:

- $AE \times EB = CE \times ED$
- To find unknown segment lengths, set up the equation and solve accordingly.

Tangents and Secants

- **Question:** What is the tangent-chord angle theorem?

- **Answer:** The angle formed between a tangent and a chord is equal to the measure of the intercepted arc. Specifically, *the measure of the angle between a tangent and a chord is half the measure of the intercepted arc.*

- **Example:** If the intercepted arc measures 120° , then the angle between the tangent and the chord measures 60° .

- **Question:** How do you find the length of a secant segment when a secant intersects a circle?

- **Answer:** Use the secant segment theorem: If a secant from outside the circle intersects the circle at points A and B, and from a point outside the circle, the secant segments are divided into segments of lengths p and q, then:

- $p \times (p + q) = (\text{length of external segment}) \times (\text{total secant length})$
- Rearranged and solved accordingly to find unknown segment lengths.

Equations of Circles

- **Question:** How do you write the equation of a circle with a given center and radius?

- **Answer:** The standard form of a circle's equation is:

$$\sqrt{(x - h)^2 + (y - k)^2} = r^2$$

- Where (h, k) is the center, and r is the radius.

- **Example:** Center at (3, -2), radius 5, the equation is:

$$-(x - 3)^2 + (y + 2)^2 = 25 \quad \text{)}$$

- **Question:** How do you find the center and radius from a circle's equation?

- **Answer:** Put the equation into standard form by completing the square if necessary. The values inside the parentheses give the center, and the constant on the right side gives the radius squared.
