Molecular Orbital Diagram Practice Problems with Answers

Understanding molecular orbital (MO) diagrams is fundamental for students studying chemistry, particularly when analyzing the bonding in diatomic and polyatomic molecules. Practice problems are invaluable for mastering the concepts of molecular orbitals, their energy levels, and how electrons occupy these orbitals. This article provides a comprehensive set of molecular orbital diagram practice problems with detailed answers, designed to enhance your grasp of this important topic and prepare you for exams or real-world applications.

Basics of Molecular Orbital Theory

Before diving into practice problems, it's essential to review some fundamental concepts of MO theory.

What Are Molecular Orbitals?

Molecular orbitals are regions in a molecule where electrons are most likely to be found. They result from the combination of atomic orbitals when atoms bond to form molecules.

Types of Molecular Orbitals

- **Bonding orbitals (σ , π):** Lower in energy, stabilize the molecule.
- **Antibonding orbitals (σ^* , π^*):** Higher in energy, destabilize the molecule.

Electron Filling and Bond Order

Electrons fill molecular orbitals following the Pauli exclusion principle and Hund's rule. Bond order is calculated as:

$$\text{Bond Order} = \frac{1}{2} (\text{Number of electrons in bonding MOs} - \text{Number of electrons in antibonding MOs})$$

Practice Problem 1: Constructing the MO Diagram for Oxygen (O_2)

Question:

Draw the molecular orbital diagram for O_2 and determine its bond order. How many unpaired electrons does it have?

Answer:

Step 1: Recognize that oxygen has 8 electrons in each atom, totaling 16 electrons for O_2 .

Step 2: Fill the molecular orbitals in order of energy:

- $1s$ (bonding) ? 2 electrons
- $1s^*$ (antibonding) ? 2 electrons
- $2s$ (bonding) ? 2 electrons
- $2s^*$ (antibonding) ? 2 electrons
- $2p$ (degenerate bonding orbitals) ? 4 electrons (2 in each degenerate orbital)
- $2p^*$ (degenerate antibonding orbitals) ? remaining 4 electrons (2 in each)

Step 3: Electron distribution:

- $1s$: 2 electrons
- $1s^*$: 2 electrons
- $2s$: 2 electrons
- $2s^*$: 2 electrons
- $2p$: 4 electrons (2 in each)
- $2p^*$: 2 electrons (1 in each degenerate orbital)

Step 4: Count electrons in bonding and antibonding orbitals:

- Bonding: $1s$, $2s$, $2p$? total = $2 + 2 + 4 = 8$ electrons
- Antibonding: $1s^*$, $2s^*$, $2p^*$? total = $2 + 2 + 2 = 6$ electrons

Step 5: Calculate bond order:

$$\text{Bond Order} = \frac{8 - 6}{2} = 1$$

Step 6: Determine unpaired electrons:

The two electrons in the π^*_{2p} orbitals are unpaired, so O_2 has 2 unpaired electrons.

Summary:

O_2 has a bond order of 2 and 2 unpaired electrons, which explains its paramagnetic behavior.

Practice Problem 2: Molecular Orbital Diagram for Nitrogen (N_2)

Question:

Construct the molecular orbital diagram for N_2 and determine its bond order. How many electrons are unpaired?

Answer:

Step 1: Nitrogen has 7 electrons per atom, so N_2 has 14 electrons total.

Step 2: Fill orbitals in order:

- $1s$ (2 electrons)
- $1s^*$ (2 electrons)
- $2s$ (2 electrons)
- $2s^*$ (2 electrons)
- $2p$ (4 electrons, 2 in each degenerate orbital)
- $2p^*$ (remaining 2 electrons)

Step 3: Distribution of electrons:

- Bonding: $1s$ (2), $2s$ (2), $2p$ (4) ? total bonding electrons = 8
- Antibonding: $1s^*$ (2), $2s^*$ (2), $2p^*$ (2) ? total antibonding electrons = 6

Step 4: Calculate bond order:

$$\text{Bond Order} = \frac{8 - 6}{2} = 1$$

Step 5: Unpaired electrons:

All electrons are paired in the $2p^*$ orbitals, so N_2 has no unpaired electrons.

Summary:

N₂ has a bond order of 3, indicating a triple bond, and is diamagnetic with no unpaired electrons.

Practice Problem 3: Comparing Bond Orders in Diatomic Molecules

Question:

Compare the bond orders of F₂, Cl₂, and Br₂ using molecular orbital diagrams. Which molecule is most stable?

Answer:

Step 1: Count electrons:

- F₂: $9 + 9 = 18$ electrons
- Cl₂: $17 + 17 = 34$ electrons
- Br₂: $35 + 35 = 70$ electrons

Step 2: Recognize that for heavier molecules (like Cl₂ and Br₂), the energy ordering of molecular orbitals changes slightly, but generally, the filling follows the same pattern with some exceptions.

Step 3: Fill orbitals accordingly:

- Both molecules will have electrons filling bonding and antibonding orbitals in the order of their energy levels.

Step 4: Bond order calculations:

- F₂:
 - Bonding electrons: 14
 - Antibonding electrons: 14
 - Bond order: $(14 - 14)/2 = 0$? F₂ is paramagnetic with unpaired electrons but overall less stable.
- Cl₂:
 - Bonding electrons: 16
 - Antibonding electrons: 10
 - Bond order: $(16 - 10)/2 = 3$
- Br₂:

- Bonding electrons: 34
- Antibonding electrons: 22
- Bond order: $(34 - 22)/2 = 6$

Step 5: Conclusion:

The higher the bond order, the more stable the molecule. Therefore, among these, Br₂ with a bond order of 3 is more stable than Cl₂, and both are more stable than F₂, which has a bond order of 0.

Note:

In practice, F₂ is less stable due to repulsion and weaker bonding, despite the bond order calculation. This illustrates that bond order is a useful but not the sole indicator of stability.

Practice Problem 4: Effect of Electron Count on Bonding

Question:

Predict whether a hypothetical diatomic molecule XY, with 10 total electrons, would be paramagnetic or diamagnetic based on its molecular orbital configuration.

Answer:

Step 1: Total electrons: 10.

Step 2: Fill molecular orbitals in order:

- σ_{1s} (2 electrons)
- σ_{1s}^* (2 electrons)
- σ_{2s} (2 electrons)
- σ_{2s}^* (2 electrons)
- σ_{2p} (remaining electrons: 2)

Step 3: Electron distribution:

- Bonding orbitals: $2 + 2 + 2 = 6$ electrons
- Antibonding orbitals: $2 + 2 + 0$ (for σ_{2p}^*)

Molecular Orbital Diagram Practice Problems with Answers: An In-Depth Review

Understanding molecular orbital (MO) diagrams is a cornerstone of modern chemistry education, offering a window into the electronic structure of molecules. Mastering the interpretation and construction of these diagrams enables students and researchers alike to predict molecular properties, bond order, magnetic behavior, and spectral features. As such, practice problems with detailed answers serve as essential tools for mastering this complex topic. This article delves into the fundamentals of molecular orbital diagrams, presents a series of practice problems with comprehensive solutions, and discusses strategies for effective problem-solving.

Introduction to Molecular Orbital Theory

Molecular orbital (MO) theory provides a quantum mechanical framework for understanding how atomic orbitals combine during chemical bonding. Unlike Lewis structures that focus solely on valence electrons and electron pairs, MO theory considers the entire molecule as a system where atomic orbitals combine to form molecular orbitals delocalized over the entire molecule.

Key concepts include:

- Constructive and destructive interference of atomic orbitals leads to bonding and antibonding molecular orbitals, respectively.
- Energy ordering of molecular orbitals depends on atomic orbital energies and symmetry considerations.
- Electron filling follows the Pauli principle and Hund's rule, filling molecular orbitals from lowest to highest energy.

Fundamentals of Constructing Molecular Orbital Diagrams

Before tackling practice problems, it is essential to understand the general steps involved:

- Identify atomic orbitals involved: Typically valence s and p orbitals.
- Determine the energy ordering: For diatomic molecules, this depends on the atomic numbers.
- Sketch the molecular orbitals: Bonding (σ , π) and antibonding (σ^* , π^*) orbitals.
- Fill electrons: Allocate electrons according to the total number of valence electrons, following Hund's rule and the Pauli principle.
- Calculate properties: Bond order, magnetic behavior, and spectral features.

Common Molecular Orbital Diagrams

Different diatomic molecules have characteristic orbital energy diagrams:

- Homodiatomic molecules with atomic numbers ≤ 7 (e.g., B_2 , C_2):

The order is $1s^2 2s^2 2p^2$

- Homodiatomic molecules with atomic numbers ≤ 8 (e.g., N_2 , O_2):

The order is $1s^2 2s^2 2p^2$

The transition from one ordering to another primarily results from the changing energy overlap of atomic orbitals as atomic number increases.

Practice Problems with Solutions

Problem 1: Construct the molecular orbital diagram for O_2 and determine its bond order and magnetic behavior.

Solution:

Step 1: Count valence electrons

Oxygen atom: 8 electrons

O_2 molecule: $2 \times 8 = 16$ electrons.

Step 2: Determine orbital energy order

For O_2 , the order is:

$1s^2, 2s^2, 2s^2, 2p^2, 2p^2, 2p^2$.

Step 3: Assign electrons to molecular orbitals:

- $1s^2$: 2 electrons
- $2s^2$: 2 electrons
- $2p^2$: 4 electrons (2 in each $2p$)
- $2p^2$: 2 electrons
- $2p^2$: 4 electrons (2 in each $2p$)
- $2p^2$: 2 electrons

Total electrons: 16.

Step 4: Fill orbitals following Hund's rule:

- $\sigma(2s)$: 2 electrons
- $\sigma^*(2s)$: 2 electrons
- $\sigma(2p)$: 4 electrons (each π orbital gets 2 electrons)
- $\pi(2p)$: 2 electrons
- $\pi^*(2p)$: 4 electrons (each π orbital gets 2 electrons)
- $\sigma^*(2p)$: 2 electrons

Step 5: Calculate bond order:

Bond order = (number of bonding electrons - number of antibonding electrons) / 2

Bonding electrons: $\sigma(2s) + \pi(2p) + \sigma(2p) = 2 + 4 + 2 = 8$

Antibonding electrons: $\sigma^*(2s) + \pi^*(2p) = 2 + 4 = 6$

Bond order = $(8 - 6)/2 = 1$

But this is incorrect; the proper bond order for O_2 is known to be 2. Let's double-check.

Correct approach:

Bonding electrons: $\sigma(2s)$: 2, $\pi(2p)$: 4, $\sigma(2p)$: 2 - total 8

Antibonding electrons: $\sigma^*(2s)$: 2, $\pi^*(2p)$: 4 - total 6

Bond order = $(8 - 6)/2 = 1$

However, experimental data shows O_2 has a bond order of 2.

Explanation:

The discrepancy arises because of the ordering of orbitals. For oxygen, the energy ordering is:

$\sigma(2s)$

But for oxygen, the $\pi(2p)$ orbitals are lower than $\sigma(2p)$, which affects the electron filling.

Final conclusion:

O₂ has 16 electrons filled as:

- σ(2s): 2 electrons
- σ*(2s): 2 electrons
- σ(2p): 4 electrons (2 in each σ)
- π(2p): 2 electrons
- π*(2p): 4 electrons (2 in each π)
- π(2p): 2 electrons

Bond order calculation:

$$\text{Bond order} = \frac{[(\text{bonding electrons}) - (\text{antibonding electrons})]}{2}$$

$$= \frac{(8 - 4)}{2} = 2$$

Magnetic behavior:

Since there are unpaired electrons in the π* orbitals, O₂ is paramagnetic.

Answer:

- Bond order: 2
- Magnetic property: Paramagnetic

Problem 2: Predict whether B₂, C₂, and N₂ are paramagnetic or diamagnetic based on their molecular orbital diagrams.

Solution:

Let's analyze each molecule:

- B₂ (5 valence electrons per atom, total 10 electrons):
- Electron filling:

σ(2s): 2 electrons

?(2s): 2 electrons

?(2p): 4 electrons (2 in each ?)

Remaining 2 electrons go into ?(2p): 2 electrons (one in each ?) orbital.

- Unpaired electrons:

The ?(2p) orbitals each have one unpaired electron.

- Magnetic property: Paramagnetic.

- C? (4 valence electrons per atom, total 8 electrons):

- Electron filling:

?(2s): 2 electrons

?(2s): 2 electrons

?(2p): 4 electrons (2 in each ?)

- No electrons in antibonding orbitals are unpaired; all electrons are paired.

- Magnetic property: Diamagnetic.

- N? (7 valence electrons per atom, total 14 electrons):

- Electron filling:

?(2s): 2 electrons

?(2s): 2 electrons

$\pi(2p)$: 4 electrons (2 in each π)

$\pi(2p)$: 2 electrons

$\pi(2p)$: 4 electrons (2 in each π) ? but in N_2 , electrons fill up to $\pi(2p)$ with paired electrons.

- All electrons are paired; no unpaired electrons.

- Magnetic property: Diamagnetic.

Summary:

| Molecule | Magnetic Behavior | Explanation |

|-----|-----|-----|

| B_2 | Paramagnetic | Unpaired electrons in π orbitals |

| C_2 | Diamagnetic | All electrons paired |

| N_2 | Diamagnetic | All electrons paired |

By systematically approaching each problem, utilizing the correct orbital diagrams, and carefully analyzing electron configurations, students and researchers can gain deeper insights into molecular behavior

Question What is the purpose of a molecular orbital diagram in chemistry? A molecular orbital diagram helps visualize the bonding interactions between atomic orbitals in a molecule, showing how electrons are distributed in molecular orbitals and enabling prediction of molecular stability and magnetic properties. How do you determine the bond order from a molecular orbital diagram? Bond order is calculated as half the difference between the number of electrons in bonding and antibonding orbitals: $\text{Bond order} = (\text{number of bonding electrons} - \text{number of antibonding electrons}) / 2$. What are the key differences in the molecular orbital diagram for O_2 compared to N_2 ? In O_2 , the molecular orbital diagram shows unpaired electrons in antibonding orbitals, making O_2 paramagnetic, whereas N_2 has all electrons paired in bonding orbitals, making it diamagnetic with a higher bond order. How do you practice and improve your skills with molecular orbital diagrams? Practice by solving various problems, such as drawing diagrams for different diatomic molecules, calculating bond orders, and predicting magnetic properties; reviewing molecular orbital energy level diagrams and working through example problems enhances understanding. What are common mistakes to avoid when solving molecular orbital diagram problems? Common mistakes include misidentifying atomic orbitals, incorrect placement of energy levels, forgetting to account for electron spins, and neglecting the order of molecular orbitals for molecules with different atomic numbers or electronic configurations.
