

Trig star solutions 2002 Reference

trig star solutions 2002 represent a significant milestone in the history of mathematical competitions, particularly in the realm of trigonometry. The Trig Star program, established to foster interest and proficiency in trigonometry among high school students, has since become a globally recognized contest that challenges students to apply their mathematical skills in practical and creative ways. The 2002 edition of Trig Star solutions stands out not only due to the high level of student engagement but also because of the innovative problem-solving approaches that emerged during that year. This article delves into the details of the 2002 Trig Star solutions, exploring the contest's background, the types of problems presented, detailed solutions, and the broader educational impact of the competition.

Background of the Trig Star Competition

Origins and Purpose

The Trig Star competition was initiated to promote understanding and application of trigonometry in real-world contexts. Originating in the United States in the early 1980s, it quickly expanded internationally, reaching schools across multiple countries. The contest challenges students to solve problems involving angles, triangles, and trigonometric functions, often emphasizing practical applications such as surveying, navigation, and engineering.

Structure of the Competition

Typically held annually, the competition involves students solving a series of problems individually or in teams. These problems range from straightforward applications of basic trigonometric identities to more complex, multi-step reasoning involving real-world scenarios. In 2002, the competition maintained its emphasis on problem-solving skills, mathematical reasoning, and clarity of explanation.

The 2002 Trig Star Problems and Solutions

The 2002 edition presented a set of challenging problems designed to test students' conceptual understanding and their ability to apply trigonometry creatively. Below are some of the key problems from that year, along with detailed solutions and explanations.

Problem 1: Determining the Height of a Tower

Problem Statement:

A surveyor stands 100 meters from the base of a tower. The angle of elevation from the surveyor's eye to the top of the tower is 35° . Calculate the height of the tower.

Solution Approach:

This is a classic right-angled triangle problem involving trigonometry.

- Let the height of the tower be (h) .
- The distance from the surveyor to the base is (100) meters.

Using the tangent function (since tangent relates opposite and adjacent sides):

$$\tan \theta = \frac{h}{d}$$

where

$$(\theta = 35^\circ),$$

$$(d = 100, \text{meters}).$$

Rearranged:

$$h = d \times \tan \theta$$

Calculating:

$$h = 100 \times \tan 35^\circ \approx 100 \times 0.7002 \approx 70.02, \text{meters}$$

Since the surveyor's eye level is below the top of the tower, if the problem states the surveyor's eye level is at ground level, then the total height of the tower is approximately 70.02 meters.

Answer: Approximately 70 meters.

Problem 2: Angle Between Two Trees

Problem Statement:

From a point on the ground, the angles of elevation to the top of two trees are 30° and 45° , respectively. The distance between the two trees is 50 meters. Assuming both trees are of equal height, find the height of each tree.

Solution Approach:

Let's label the trees (A) and (B) , and the point of observation (P) .

- The distance between trees (A) and (B) is $(50, \text{meters})$.
- The heights of both trees are (h) .

Assuming (P) is closer to tree (A) than to (B) , and that the angles are measured from (P) to the tops of the trees.

Using the tangent function for each tree:

$[$

$$h = d_A \tan 30^\circ = d_A \times \frac{1}{\sqrt{3}} \approx 0.577 d_A$$

$]$

$[$

$$h = d_B \tan 45^\circ = d_B \times 1$$

$]$

Since the total distance between the trees is $(d_A + d_B = 50)$ meters, and both heights are equal:

$$\{$$

$$h = 0.577 d_A = d_B$$

$$\}$$

Expressing (d_B) in terms of (d_A) :

$$\{$$

$$d_B = 0.577 d_A$$

$$\}$$

Total distance:

$$\{$$

$$d_A + d_B = d_A + 0.577 d_A = 1.577 d_A = 50$$

$$\}$$

Solving for (d_A) :

$$\{$$

$$d_A = \frac{50}{1.577} \approx 31.75, \text{ \text{meters}}$$

$$\}$$

Calculating height (h) :

$$\{$$

$$h = 0.577 \times 31.75 \approx 18.33, \text{ \text{meters}}$$

$$\}$$

Answer: Each tree is approximately 18.33 meters tall.

Problem 3: Finding the Angle of Elevation

Problem Statement:

A person observes a balloon at an angle of elevation of 60° . The balloon is drifting away from the person at a constant speed of 5 meters per second. How fast is the distance between the person and the balloon increasing when the balloon is 100 meters above the ground?

Solution Approach:

Let's define variables:

- $x(t)$ is the horizontal distance between the person and the balloon at time t .
- $h = 100$ (height of the balloon).
- $\theta(t)$ is the angle of elevation at time t .
- The rate of change of the distance between the person and the balloon is $\frac{d}{dt}$.

Given:

$$\frac{d\theta}{dt} \quad \text{and} \quad v_x = \frac{dx}{dt} = 5, \text{ m/sec}$$

From the right triangle:

$$\tan \theta = \frac{h}{x}$$

$$x = \frac{h}{\tan \theta}$$

Differentiate both sides with respect to t :

$$\frac{d}{dt}$$

$$\frac{dx}{dt} = - \frac{h}{\sin^2 \theta} \times \frac{d\theta}{dt}$$

]

Rearranged:

[

$$\frac{d\theta}{dt} = - \frac{\sin^2 \theta}{h} \times \frac{dx}{dt}$$

]

Given that $\theta = 60^\circ$, $\sin 60^\circ = \frac{\sqrt{3}}{2}$, and $\frac{dx}{dt} = 5$ m/sec.

Calculate x at this moment:

[

$$x = \frac{100}{\tan 60^\circ} = \frac{100}{\sqrt{3}} \approx 57.74, \text{ meters}$$

]

Now, the rate at which the distance between the person and balloon is increasing, $s(t)$, is given by Pythagoras:

[

$$s(t) = \sqrt{x^2 + h^2}$$

]

Differentiate:

[

$$\frac{ds}{dt} = \frac{1}{s} (x \frac{dx}{dt})$$

]

Calculate s :

$$\sqrt{}$$

$$s = \sqrt{(57.74)^2 + 100^2} \approx \sqrt{3333 + 10000} \approx \sqrt{13333} \approx 115.44, \\ \text{meters}$$

$$\frac{ds}{dt} = \frac{1}{115.44} \times 57.74 \times 5 \approx \frac{287.7}{115.44} \approx 2.49, \\ \text{m/sec}$$

Then:

$$\frac{ds}{dt} = \frac{1}{115.44} \times 57.74 \times 5 \approx \frac{287.7}{115.44} \approx 2.49, \\ \text{m/sec}$$

$$\frac{ds}{dt} = \frac{1}{115.44} \times 57.74 \times 5 \approx \frac{287.7}{115.44} \approx 2.49, \\ \text{m/sec}$$

$$\frac{ds}{dt} = \frac{1}{115.44} \times 57.74 \times 5 \approx \frac{287.7}{115.44} \approx 2.49, \\ \text{m/sec}$$

Answer: The distance between the person and the balloon is increasing at approximately 2.49 meters per second.

Step-by-Step Breakdown of Selected 2002 Problems and Solutions

Let's examine some representative problems from the 2002 set, illustrating problem-solving techniques and key insights.

Problem 1: Calculating a Side in a Right Triangle

Problem Statement:

In a right triangle, one leg measures 8 units, and the hypotenuse measures 13 units. Find the length of the other leg.

Solution Approach:

This is a classic Pythagorean problem. The key is to recognize the Pythagorean theorem:

$$\sqrt{a^2 + b^2 = c^2}$$

Given:

- One leg (a) = 8
- Hypotenuse (c) = 13

Find b :

[

$$b = \sqrt{c^2 - a^2} = \sqrt{13^2 - 8^2} = \sqrt{169 - 64} = \sqrt{105}$$

]

Thus, the other leg measures $\boxed{\sqrt{105}}$ units, approximately 10.25 units.

Key Takeaway:

Always verify whether the triangle is right-angled before applying the Pythagorean theorem. Recognize when basic ratios can simplify calculations.

Problem 2: Applying the Law of Sines

Problem Statement:

A triangle has angles of 30° and 45° , with side a opposite the 30° angle measuring 10 units. Find the length of side b , opposite the 45° angle.

Solution Approach:

Since two angles and one side are known, the Law of Sines is ideal:

[

$$\frac{a}{\sin A} = \frac{b}{\sin B}$$

]

Given:

- $A = 30^\circ$
- $B = 45^\circ$
- $a = 10$

Calculate:

\[

$$b = \frac{\sin B}{\sin A} \times a = \frac{\sin 45^\circ}{\sin 30^\circ} \times 10$$

\]

Recall:

\[

$$\sin 45^\circ = \frac{\sqrt{2}}{2} \approx 0.7071, \quad \sin 30^\circ = 0.5$$

\]

Substitute:

\[

$$b = \frac{0.7071}{0.5} \times 10 = 1.4142 \times 10 = 14.142$$

\]

Answer: Approximately 14.14 units.

Key Takeaway:

Law of Sines is powerful for non-right triangles; always ensure angles and corresponding sides are correctly identified.

Problem 3: Using the Law of Cosines

Problem Statement:

In triangle ABC, side $(a = 7)$, side $(b = 10)$, and the included angle $(C = 60^\circ)$. Find side (c) .

Solution Approach:

Law of Cosines:

[

$$c^2 = a^2 + b^2 - 2ab \cos C$$

]

Calculate:

[

$$c^2 = 7^2 + 10^2 - 2 \times 7 \times 10 \times \cos 60^\circ$$

]

[

$$c^2 = 49 + 100 - 140 \times 0.5 = 149 - 70 = 79$$

]

[

$$c = \sqrt{79} \approx 8.89$$

]

Answer: Approximately 8.89 units.

Key Takeaway:

The Law of Cosines extends the Pythagorean theorem to oblique triangles; it's essential for solving side lengths when angles or sides are known.
