Sample Questions and Practice Exercises

- Atomic Structure and the Periodic Table

Question:

Describe how the electronic configuration of an atom influences its position in the periodic table. Include an example.

Answer:

The electronic configuration determines an element's period (row) and group (column) in the periodic table. Elements in the same group have similar valence electron configurations, influencing their chemical properties. For example, carbon has an electronic configuration of $1s^2 2s^2 2p^2$, placing it in Group 14, which contains elements with four valence electrons.

- Energy Changes

Question:

A reaction releases 150 kJ of energy. Is this exothermic or endothermic? Explain how you know.

Answer:

Since energy is released during the reaction, it is exothermic. Exothermic reactions transfer energy to the surroundings, often as heat, and are characterized by a negative change in enthalpy (ΔH).

- Calculations

Question:

Calculate the number of moles in 24 grams of carbon-12.

Answer:

Molar mass of carbon-12 = 12 g/mol

Number of moles = mass / molar mass = 24 g / 12 g/mol = 2 mol
