- All radii of a circle are equal.
- The diameter is twice the radius.
- A tangent is perpendicular to the radius at the point of tangency.

- Inscribed and Central Angles

Definitions

- Central angle: An angle with its vertex at the center of the circle, with sides intersecting the circle.
- Inscribed angle: An angle with its vertex on the circle, with sides intersecting the circle.

Theorems

- Inscribed Angle Theorem: An inscribed angle intercepts an arc; its measure is half the measure of that arc.
- Central Angle Theorem: The measure of a central angle is equal to the measure of its intercepted arc.

- Arcs and Their Measures

- Minor arc: An arc less than 180° .
- Major arc: An arc greater than 180° .
- Semicircle: An arc that measures exactly 180° .

- Properties of Tangents and Secants

- Tangents from a common point outside the circle are equal in length.
- The power of a point theorem relates lengths of segments created by secants and tangents.

- Segment and Sector Measures

- Chord segments: The product of the segments created when two chords intersect inside a circle.
- Secant-secant segments: The product of external segment and entire secant segment are equal when dealing with two secants.

Sample Test Questions and Answers (Ch 9 Holt Geometry)

- Identifying Properties of Circles

Question:

In a circle, if two chords are equal in length, what can be said about their corresponding arcs?

Answer:

The arcs intercepted by equal chords are also equal in measure.

- Applying Theorems

Question:

In the diagram, a tangent and a secant intersect outside a circle. If the external segment of the secant is 4 units and the entire secant segment is 10 units, what is the length of the tangent segment?

Answer:

Using the Power of a Point theorem:

$$(\text{tangent length})^2 = \text{external secant segment} \times \text{entire secant segment}$$

Let x = tangent length:

$$x^2 = 4 \times 10 = 40$$

$$x = \sqrt{40} \approx 6.32 \text{ units}$$

- Calculating Arc Measures

Question:

An inscribed angle intercepts an arc measuring 80° . What is the measure of the inscribed angle?

Answer:

The inscribed angle is half the measure of its intercepted arc:

$$\text{Angle} = 80^\circ / 2 = 40^\circ$$

- Solving for Unknowns in Circles

Question:

In a circle, two inscribed angles intercept the same arc. If one angle measures 70° , what is the measure of the other inscribed angle?

Answer:

Since they intercept the same arc, both inscribed angles are equal:

The other angle also measures 70° .

An inscribed angle intercepting a semicircular arc measures 90 degrees. This is a direct application of the Inscribed Angle Theorem, which states that an inscribed angle measures half the measure of its intercepted arc. Since the intercepted arc is a semicircle (180°), the inscribed angle equals 90° .

Key Tip:

Always identify whether the angle is inscribed or central, as their measures relate differently to the intercepted arc.

- Using the Power of a Point Theorem

Question Example:

Given a point outside a circle from which two secants are drawn, intersecting the circle at points A, B and C, D respectively. If the lengths of segments are known, how do you find the unknown segment?

Answer and Explanation:

The Power of a Point Theorem states that:

The product of the entire secant segment and its external part equals the product of the other secant's external part and its entire secant.

Mathematically:

$$[(\text{External segment}) \times (\text{External} + \text{Internal segment}) = (\text{External segment}) \times (\text{External} + \text{Internal segment})]$$

This allows students to set up equations based on known and unknown segment lengths and solve algebraically.

Practical Tip:

Carefully label all segments and ensure correct application of the theorem to avoid common mistakes.

- Applying Congruence and Similarity in Circles

Question Example:

Two chords intersect inside a circle, forming angles at the intersection point. How can you determine if the segments are proportional?

Answer and Explanation:

When two chords intersect inside a circle, the Chords Intersection Theorem states that the products of the segments are equal:

$$[AE \times EC = BE \times ED]$$

If two angles are inscribed and subtend equal arcs, then the corresponding segments are proportional, and the triangles formed are similar by the AA (Angle-Angle) Similarity Criterion.

Study Strategy:

Draw and label all relevant angles and segments carefully to spot similar triangles or proportional segments.

Sample Questions and Their Answers for Holt Geometry Chapter 8A

Below are some representative questions along with detailed solutions to help you prepare.

Question 1: Identifying Inscribed and Central Angles

Given a circle with an inscribed angle measuring 40° , find the measure of the intercepted arc.

Answer:

The measure of an inscribed angle is half the measure of its intercepted arc.

Solution:

- Inscribed angle = 40°
- Intercepted arc = $2 \times 40^\circ = 80^\circ$

Key Point:

The intercepted arc is 80° .

Question 2: Tangent and Secant Theorem Application

In a circle, a tangent and a secant intersect outside the circle. The tangent segment measures 10

units, and the secant segment from the external point to the far intersection point measures 18 units. Find the length of the external secant segment from the external point to the nearer intersection point.

Answer:

Using the Tangent-Secant Power Theorem:

If a tangent segment and a secant segment are drawn from a point outside a circle, then:

$$(\text{tangent})^2 = \text{external secant segment} \times \text{whole secant segment}$$

Let x be the length from the external point to the nearer intersection point on the secant.

Then:

$$10^2 = x \times 18$$

$$100 = 18x$$

$$x = \frac{100}{18} = \frac{50}{9} \approx 5.56$$

Key Point:

The external secant segment measures approximately 5.56 units.

Question 3: Calculating Arc Measures

A chord in a circle subtends an inscribed angle of 70° . Find the measure of the arc intercepted by this angle.

Answer:

Using the inscribed angle theorem:

Inscribed angle = half the measure of its intercepted arc.

$$\text{Arc} = 2 \times 70^\circ = 140^\circ$$

Key Point:

The intercepted arc measures 140° .
