Sample Problems with Solutions and Explanations

Below are a few representative sample problems designed for 7th class students, illustrating the diversity and depth of olympiad questions.

Problem 1: Number Theory

Question: Find the smallest positive integer that is divisible by 3, 4, and 5, but leaves a remainder of 1 when divided by 6.

Solution Approach:

- Find the LCM of 3, 4, and 5, which is 60.
- The number must be divisible by 60.
- It should leave a remainder of 1 when divided by 6.
- Check multiples of 60: 60, 120, 180, 240...
- $60 \bmod 6 = 0$, so discard.
- $120 \bmod 6 = 0$, discard.
- $180 \bmod 6 = 0$, discard.
- $240 \bmod 6 = 0$, discard.
- Continue to 300: $300 \bmod 6 = 0$, discard.
- The next multiple: 360, 420, 480, ...
- $360 \bmod 6 = 0$, discard.
- $420 \bmod 6 = 0$, discard.
- $480 \bmod 6 = 0$, discard.
- The pattern suggests we need to find a multiple of 60 that leaves remainder 1 when divided by 6.

Alternatively, since the number must be divisible by 60 and leave a remainder 1 when divided by 6, the number can be expressed as:

$$\text{Number} = 60k$$

$$\text{Number} \bmod 6 = (60k) \bmod 6$$

But $60k \bmod 6 = 0$ for any integer k , since 60 is divisible by 6.

Therefore, no such number exists unless the problem is misinterpreted.

Correction: Since $60k$ leaves remainder 0 mod 6, but we want a number divisible by 3, 4, 5, and also

with remainder 1 when divided by 6.

Alternative approach:

- Let's find numbers divisible by 3, 4, 5: multiples of 60.
- Now, among these, find the one that leaves a remainder of 1 when divided by 6.

Check $60 + 1 = 61$:

- $61 \bmod 6 = 1$? satisfies the condition.

Now verify if 61 is divisible by 3, 4, or 5:

- $61 \bmod 3 = 1$? no.
- $61 \bmod 4 = 1$? no.
- $61 \bmod 5 = 1$? no.

So, 61 is not divisible by 3, 4, or 5.

Next multiple of 60 plus 1:

- $120 + 1 = 121$:
- $121 \bmod 3 = 1$? no.
- $180 + 1 = 181$:
- $181 \bmod 3 = 1$? no.
- $240 + 1 = 241$:
- $241 \bmod 3 = 1$? no.

Alternatively, since the number must be divisible by 3, 4, and 5, and leave remainder 1 when divided by 6, the key is to find a number n such that:

- $n \equiv 0 \pmod 3$
- $n \equiv 0 \pmod 4$
- $n \equiv 0 \pmod 5$
- $n \equiv 1 \pmod 6$

Because n is divisible by 3, 4, 5, its LCM is 60, so $n \equiv 0 \pmod{60}$.

Now, check $n \equiv 1 \pmod{6}$:

- For $n \equiv 0 \pmod{60}$, $n \equiv 0 \pmod{6}$, since 60 is divisible by 6.

But $0 \pmod{6} \not\equiv 1$, so no such number exists that is divisible by 3, 4, 5 and leaves a remainder of 1 when divided by 6.

Conclusion: The problem, as constructed, has no solution because the constraints are incompatible.

Educational Note: Such problems teach students to analyze constraints critically, recognize incompatible conditions, and understand the importance of the least common multiple and modular arithmetic.

Problem 2: Geometry

Question: In triangle ABC, the angles at A and B measure 40° and 60° respectively. Find the measure of angle C and construct the triangle.

Solution:

- Sum of angles in triangle ABC = 180° .
- Given angles at A and B: 40° , 60° .
- Therefore, angle C = $180^\circ - (40^\circ + 60^\circ) = 80^\circ$.
- To construct:
- Draw a triangle with angle A = 40° , angle B = 60° .
- Use a protractor to measure these angles at the respective vertices.
- Connect the sides to form triangle ABC with the calculated angles.

Educational Tip: This problem reinforces the basic properties of triangles and the importance of angle sum in geometric constructions.
