This article provides comprehensive answers to the Half Life Gizmo, guiding you through the key concepts, solving typical problems, and offering tips to improve your understanding of half-life phenomena.

What Is the Half Life Gizmo?

The Half Life Gizmo is an online simulation that models radioactive decay processes. It allows users to manipulate variables such as initial sample size, decay rate, and time to observe how substances diminish over periods. The Gizmo visually demonstrates how half-lives determine the rate at which a radioactive substance decays, making it a valuable learning aid for students.

Key features of the Gizmo include:

- Adjustable initial sample size
- Variable half-life duration
- Real-time decay visualization
- Data tables and graphs for analysis

Understanding Radioactive Decay and Half-Life

Before diving into specific answers, it's essential to understand the core concepts:

Radioactive Decay

Radioactive decay is a spontaneous process where unstable atomic nuclei lose energy by emitting radiation. This decay reduces the number of radioactive atoms over time.

Half-Life

The half-life of a radioactive isotope is the time required for half of the radioactive atoms in a sample to decay. It remains constant for a given isotope and is a key parameter for understanding decay rates.

Basic Concepts and Definitions

To effectively use the Half Life Gizmo and solve related problems, familiarize yourself with these terms:

- **Initial amount (N_0):** The starting quantity of radioactive atoms.
- **Remaining amount (N):** The quantity of radioactive atoms remaining after a certain time.
- **Half-life ($t_{1/2}$):** Time taken for half of the initial amount to decay.
- **Decay constant (λ):** Probability of decay per unit time, related to half-life by $\lambda = \ln(2)/t_{1/2}$.
- **Decay equation:** $N = N_0 e^{(-\lambda t)}$, where t is time elapsed.

Common Questions and Their Answers

This section addresses typical questions students encounter when working with the Half Life Gizmo.

1. How do you calculate the remaining amount of a substance after a certain time?

Answer:

Use the exponential decay formula:

$$N = N_0 e^{(-\lambda t)}$$

Where:

- N_0 = initial amount
- λ = decay constant ($\lambda = \ln(2)/t_{1/2}$)
- t = elapsed time

Step-by-step approach:

- Determine the decay constant using the known half-life.
- Plug in the initial amount, decay constant, and elapsed time into the formula.
- Calculate N to find the remaining amount.

Example:

If the initial amount is 100 grams, half-life is 10 hours, and 20 hours have passed:

$$- \lambda = \ln(2)/10 \approx 0.0693$$

$$- N = 100 e^{(-0.0693 \times 20)} \approx 100 \times e^{(-1.386)} \approx 100 \times 0.25 \approx 25 \text{ grams}$$

So, approximately 25 grams remain after 20 hours.

2. How many half-lives have passed after a certain amount of time?

Answer:

Divide the elapsed time by the half-life:

$$\text{Number of half-lives} = t / t_{1/2}$$

Example:

If 30 hours have passed, and the half-life is 10 hours:

$$\text{Number of half-lives} = 30 / 10 = 3$$

This means three half-lives have occurred.

3. How long does it take for a substance to decay to a specific fraction of its original amount?

Answer:

Use the decay formula rearranged to solve for time:

$$t = (\ln(N/N_0)) / (-\lambda)$$

For decay to a specific fraction (f), $N = f \times N_0$:

$$t = (\ln(f)) / (-\lambda)$$

Example:

To find when only 25% remains ($f = 0.25$), with a half-life of 10 hours:

$$\begin{aligned} & - \lambda = -0.0693 \\ & - t = \ln(0.25) / (-0.0693) = (-1.386) / (-0.0693) = 20 \text{ hours} \end{aligned}$$

Thus, it takes approximately 20 hours for 25% of the substance to remain, which aligns with two half-lives.

Strategies for Using the Gizmo Effectively

Providing clear, accurate answers to the gizmo's questions not only reinforces foundational knowledge but also enhances scientific literacy. This article offers a detailed, analytical exploration of common questions associated with the half-life gizmo, explaining core concepts, demonstrating calculations, and discussing their broader implications.

Understanding the Half-Life Gizmo: An Overview

The half-life gizmo serves as a virtual laboratory, allowing users to manipulate variables such as initial sample size, decay rate, and time intervals. Its primary purpose is educational: to illustrate how radioactive substances decay over time and to facilitate calculations related to half-life—the time required for half of a sample to decay. The gizmo typically presents data tables, decay graphs, and interactive elements that challenge users to interpret and analyze decay patterns.

Key features of the gizmo include:

- Simulated decay of radioactive samples
- Graphical representations of decay curves
- Input fields for initial quantities and elapsed time
- Questions prompting calculations of remaining substance, half-lives elapsed, and decay constants

Understanding the mechanics of the gizmo is essential for answering its questions accurately.

Fundamental Concepts of Radioactive Decay and Half-Life

Before delving into specific answers, it's crucial to revisit core principles:

Radioactive Decay

Radioactive decay is a stochastic process where unstable nuclei spontaneously emit particles or energy to become more stable. This process is probabilistic at the individual nucleus level but exhibits predictable behavior at the population level.

Half-Life ($t_{1/2}$)

The half-life is the time it takes for half of a given amount of a radioactive isotope to decay. It is a characteristic property of each isotope and remains constant regardless of the initial quantity.

Decay Constant (?)

The decay constant relates to the probability per unit time that a nucleus will decay. The relationship between half-life and decay constant is:

$$t_{1/2} = \ln(2) / \lambda$$

Decay Equation

The amount of substance remaining after time t can be modeled by:

$$N(t) = N_0 e^{-\lambda t}$$

where:

- $N(t)$ = remaining quantity at time t
- N_0 = initial quantity
- λ = decay constant
- t = elapsed time

Common Questions and Their Solutions

The gizmo typically prompts users with questions such as: "How much of the sample remains after a certain time?" or "How long does it take for the sample to decay to a specific amount?" Here, we analyze these questions with detailed explanations.

Question 1: How much of the sample remains after a certain time?

Answer Approach:

- Identify the initial amount (N_0) given.
- Determine the decay constant (λ), either provided or calculated from the half-life.
- Use the decay equation to find $N(t)$:

$$N(t) = N_0 e^{-\lambda t}$$

- Plug in known values and compute.

Example:

Suppose the initial sample is 100 grams, the half-life is 10 hours, and the time elapsed is 20 hours.

- Calculate λ :

$$\lambda = \ln(2) / t_{1/2} = 0.693 / 10 = 0.0693 \text{ hr}^{-1}$$

- Calculate remaining amount:

$$N(20) = 100 e^{-0.0693 \cdot 20} = 100 e^{-1.386} \approx 100 \cdot 0.25 \approx 25 \text{ grams}$$

Result: Approximately 25 grams remain after 20 hours.

Question 2: How many half-lives have passed?

Answer Approach:

Divide the elapsed time by the half-life:

$$\text{Number of half-lives} = t / t_{1/2}$$

Example:

If 30 hours have elapsed and the half-life is 10 hours:

$$\text{Number of half-lives} = 30 / 10 = 3$$

Implication: The sample has undergone three half-lives, so the remaining amount is:

$$\text{Remaining fraction} = (1/2)^3 = 1/8$$

$$\text{Remaining amount} = N_0 \cdot 1/8$$

Question 3: How long does it take for the sample to decay to a specific amount?

Answer Approach:

- Use the decay equation:

$$N(t) = N_0 e^{-\lambda t}$$

- Rearrange to solve for t:

$$t = -(1/\lambda) \ln(N(t)/N_0)$$

- Plug in known values.

Example:

Initial amount: 100 grams

Target amount: 12.5 grams

Half-life: 10 hours

- Calculate λ :

$$\lambda = 0.693 / 10 = 0.0693 \text{ hr}^{-1}$$

- Find t:

$$t = -(1/0.0693) \ln(12.5/100) = -14.43 \ln(0.125) = -14.43 (-2.079) = 30 \text{ hours}$$

Result: It takes approximately 30 hours for the sample to decay to 12.5 grams.

Understanding Decay Graphs and Data Tables

The gizmo often includes decay curves and data tables that display quantities at various time points. Interpreting these correctly is vital.

Decay Curves

- Exhibit exponential decline.

- The slope becomes less steep over time.
- The curve's shape reflects the constant proportional decay rate.

Data Tables

- Show discrete measurements of remaining substance at specific intervals.
- Can be used to verify calculations or estimate decay constants.

Analytical Tip: Fit the data to the exponential decay model to derive the decay constant or half-life if not explicitly provided.

Common Pitfalls and Clarifications

While the principles seem straightforward, students often encounter misconceptions or calculation errors.

Misconception 1: Confusing Half-Life with Decay Constant

Clarification: The half-life is a fixed time interval; the decay constant is a rate parameter. They are related via $\lambda = \ln(2)/t_{1/2}$.

Misconception 2: Assuming the Decay Stops at Zero

Clarification: Radioactive decay asymptotically approaches zero but never truly reaches it. The amount decreases exponentially over time.

Misconception 3: Ignoring Units

Clarification: Always pay attention to units (hours, days, seconds) and ensure consistency in calculations.

Clarification: Decay is Probabilistic at the Nucleus Level but Predictable at the Population Level

The stochastic nature of individual nuclei means decay timing is random, but large populations exhibit predictable decay patterns.

Implications and Broader Context of Half-Life Calculations

Understanding half-life calculations extends beyond classroom exercises. They are crucial in various fields:

- Medicine: Determining dosage and timing for radioactive tracers.
- Archaeology: Radiocarbon dating hinges on carbon-14's half-life.
- Nuclear Energy: Managing radioactive waste relies on understanding decay rates.
- Environmental Science: Tracking pollutant decay or persistence.

Moreover, mastery of these calculations fosters critical thinking about exponential growth and decay, probabilistic processes, and data interpretation in scientific research.

nuclear chemistry half life answers

nuclear chemistry half life answers are essential for students, educators, and professionals working in the fields of nuclear physics, radiology, medicine, and environmental science. Understanding how radioactive substances decay over time is fundamental to grasping concepts such as radiation safety, radiometric dating, and nuclear energy production. This article aims to provide comprehensive insights into the concept of half-life in nuclear chemistry, explore common questions and answers, and clarify key principles to enhance your understanding of this vital topic.

Understanding the Concept of Half-Life in Nuclear Chemistry

What Is Half-Life?

Half-life is the amount of time required for half of the radioactive nuclei in a sample to decay. It is a characteristic property of each radioactive isotope, meaning that different isotopes have distinct half-lives. For example, Carbon-14 has a half-life of approximately 5,730 years, while Uranium-238 has a half-life of about 4.5 billion years.

Why Is Half-Life Important?

Knowing the half-life of a radioactive isotope allows scientists to:

- Determine the age of archaeological artifacts (radiocarbon dating).
- Calculate how long a radioactive source remains hazardous.
- Design appropriate medical treatments involving radiotracers.
- Model the decay process in nuclear reactors and waste management.

Common Questions and Answers About Nuclear Chemistry Half-Life

1. How Is the Half-Life of a Radioactive Isotope Calculated?

The half-life can be calculated using the decay constant (λ), which describes the probability of decay per unit time. The fundamental relationship is:

$$- T_{1/2} = \ln(2) / \lambda$$

where:

- $T_{1/2}$ is the half-life,
- λ (lambda) is the decay constant,
- $\ln(2)$ is the natural logarithm of 2 (~0.693).

Alternatively, if you have the initial quantity of a substance and its remaining quantity after a certain time, you can determine the half-life with the equation:

$$- N(t) = N_0 \times (1/2)^{(t / T_{1/2})}$$

where:

- $N(t)$ is the remaining quantity after time t ,
- N_0 is the initial quantity.

2. What Does It Mean When a Radioactive Sample Has Decayed by Half?

When a sample has undergone one half-life, only 50% of the original radioactive nuclei remain. After two half-lives, only 25% remains; after three, 12.5%; and so forth. This exponential decay process continues until the activity becomes negligible.

3. Is Half-Life the Same for All Isotopes?

No. Each isotope has its own unique half-life, which can range from fractions of a second to billions of years. This variability is due to differences in nuclear stability and decay pathways.

4. How Does Half-Life Relate to Radioactive Decay Rate?

The decay rate is directly related to the half-life. A shorter half-life indicates a faster decay rate, meaning the isotope is less stable. Conversely, a longer half-life signifies a more stable isotope.

5. Can Half-Life Be Used to Determine the Age of an Object?

Yes. Radiocarbon dating relies on measuring the remaining Carbon-14 in organic materials and calculating the time elapsed based on its known half-life. Similarly, other isotopic dating methods use half-lives to determine ages of rocks and fossils.

Applications of Half-Life in Various Fields

1. Radiocarbon Dating

Radiocarbon dating is a technique used to estimate the age of ancient organic materials. By measuring the remaining Carbon-14 in a sample and knowing its half-life (~5,730 years), scientists can calculate how long it has been since the organism died.

2. Nuclear Medicine

Radioisotopes with specific half-lives are used in medical diagnostics and treatments. For example, Technetium-99m, with a half-life of about 6 hours, is widely used in imaging procedures due to its suitable decay time and gamma radiation emission.

3. Nuclear Power and Waste Management

Understanding the half-lives of radioactive waste products helps in designing storage solutions that remain safe over thousands or millions of years. Long-lived isotopes like Plutonium-239 require secure containment strategies.

4. Environmental Monitoring

Monitoring the decay of radioactive pollutants involves knowing their half-lives to assess environmental impact and remediation timelines.

Common Misconceptions About Half-Life

1. Half-Life Means Radioactive Material Disappears After One Half-Life

This is a common misconception. After one half-life, only half of the original radioactive nuclei remain; the rest continue to decay. The decay process is ongoing, and the material never completely disappears unless it has a half-life of zero.

2. Half-Life Is the Exact Time for All Nuclei to Decay

Half-life is a statistical measure, representing the average time for half of a large number of atoms to decay. In small samples, decay times can vary due to randomness.

3. All Radioisotopes Have the Same Half-Life

Different isotopes have vastly different half-lives, from fractions of a second to billions of years.

Practical Tips for Working with Half-Life Calculations

- Always keep track of units ? time should be consistent throughout calculations.
- Use logarithmic functions carefully when solving for unknown variables.
- Remember that decay follows an exponential pattern; linear approximations are invalid over long periods.
- Leverage available decay constant data to simplify calculations.

Nuclear chemistry half-life answers are fundamental to understanding the stability and decay

processes of radioactive isotopes. Whether you're a student grappling with the concepts of nuclear decay or a professional working in fields like radiology, nuclear power, or environmental science, mastering the idea of half-life is essential. This guide aims to demystify half-life calculations, provide clarity on common questions, and offer practical tips to enhance your understanding of nuclear chemistry's core concepts.

Understanding the Concept of Half-Life in Nuclear Chemistry

What Is Half-Life?

At its core, the half-life of a radioactive isotope is the amount of time it takes for half of the radioactive nuclei in a sample to decay. This decay process is random at the individual nucleus level but exhibits a predictable statistical pattern across a large population of nuclei.

For example, if you start with 100 grams of a radioactive substance with a half-life of 10 hours, after 10 hours, only 50 grams will remain, with the other 50 grams having decayed into more stable forms. After another 10 hours (total 20 hours), only 25 grams will remain, and so on.

Why Is Half-Life Important?

Understanding half-life helps determine:

- The age of archaeological finds (carbon dating).
- Safety protocols for handling radioactive materials.
- The efficiency and lifespan of nuclear reactors.
- Medical treatment planning involving radioactive isotopes.

How to Calculate Half-Life: Step-by-Step Guide

Basic Decay Formula

The amount of radioactive substance remaining after a certain time can be calculated using the exponential decay formula:

$$N(t) = N_0 \left(\frac{1}{2} \right)^{t / T_{1/2}}$$

Where:

- $N(t)$ = amount remaining after time t

- N_0 = initial amount
- $T_{1/2}$ = half-life
- t = elapsed time

Alternatively, to find the half-life when you have decay data, you can use the decay constant λ :

$$T_{1/2} = \ln(2) / \lambda$$

Common Types of Questions and How to Approach Them

- Calculating Remaining Quantity After a Given Time

Question:

A sample of uranium-238 has a half-life of approximately 4.5 billion years. How much of a 100-gram sample remains after 9 billion years?

Answer Approach:

- Since 9 billion years is twice the half-life (2×4.5 billion), the sample will have undergone two half-lives.
- Each half-life reduces the amount by half:
- After 1 half-life: 100 g $\rightarrow$ 50 g
- After 2 half-lives: 50 g $\rightarrow$ 25 g

Result: 25 grams remain.

- Determining Half-Life From Decay Data

Question:

A 200-gram sample of a radioactive isotope decays to 25 grams in 12 hours. What is its half-life?

Answer Approach:

- Determine how many half-lives have passed:
- 200 g $\rightarrow$ 100 g after 1 half-life

- 100 g $\rightarrow$ 50 g after 2 half-lives
- 50 g $\rightarrow$ 25 g after 3 half-lives
- Total time: 12 hours
- Number of half-lives: 3

Calculate:

$$T_{1/2} = \text{Total time} / \text{Number of half-lives} = 12 \text{ hours} / 3 = 4 \text{ hours}$$

Result: The half-life is 4 hours.

- Finding the Decay Constant λ

Question:

A radioactive isotope has a half-life of 10 hours. What is its decay constant λ ?

Answer approach:

Use the relation:

$$T_{1/2} = \ln(2) / \lambda$$

Rearranged to:

$$\lambda = \ln(2) / T_{1/2}$$

Calculate:

$$\lambda = 0.693 / 10 \text{ hours} = 0.0693 \text{ hours}^{-1}$$

Practical Applications and Examples

Radioactive Dating

One of the most well-known applications of nuclear chemistry half-life answers is radiometric dating. For example, carbon-14 has a half-life of approximately 5,730 years, allowing scientists to estimate the age of archaeological samples. The general process involves measuring the remaining amount of C-14 and calculating how many half-lives have passed since the organism's death.

Medical Uses

Radioisotopes like iodine-131, with a half-life of about 8 days, are used in medical diagnostics and treatment. Understanding its half-life helps in planning safe handling, dosage, and disposal.

Nuclear Power & Waste Management

Half-life data for various isotopes in nuclear waste informs storage duration and safety measures. Isotopes with long half-lives, like plutonium-239 (~24,100 years), require secure, long-term containment solutions.

Common Misconceptions About Half-Life

- Half-life is the time for the entire sample to decay:

Incorrect. It is the time for half of the nuclei to decay, not the full decay.

- All atoms decay at the same rate:

Incorrect. Decay is a probabilistic process; individual atoms decay unpredictably, but the statistical decay rate is predictable.

- Half-life is the same for all isotopes:

Incorrect. Each isotope has its own unique half-life.

Tips for Mastering Nuclear Chemistry Half-Life Questions

- Memorize the key formulas:
 - $N(t) = N_0 \left(\frac{1}{2}\right)^{t / T_{1/2}}$
 - $T_{1/2} = \ln(2) / \lambda$

- Practice with real data:

Use practice problems involving different isotopes and decay scenarios.

- Understand exponential decay:

Recognize the pattern of decay and how it relates to half-life.

- Convert units carefully:

Ensure all time units are consistent when calculating.

- Use logarithms when needed:

For example, calculating decay constants from half-life involves natural logarithms.

Final Thoughts

Mastering nuclear chemistry half-life answers requires a blend of conceptual understanding and practical problem-solving skills. Whether you're calculating remaining quantities, decay constants, or interpreting decay data, fluency with the formulas and decay patterns will significantly enhance your confidence. Remember, the key is not just memorizing formulas but understanding the decay process's probabilistic nature and how it applies to real-world scenarios—from dating fossils to managing nuclear waste. Half life lab answer key for pennies

Half life lab answer key for pennies is a commonly sought resource for students conducting experiments related to radioactive decay and half-life calculations. Understanding the principles behind half-life is essential for mastering concepts in nuclear chemistry and physics, especially when working on labs involving real-world examples like pennies. This article provides a comprehensive guide to the half-life lab involving pennies, complete with explanations, answer keys, and tips to help students succeed in their experiments and understand the underlying science.

Understanding the Half-Life Concept in the Penny Lab

What Is Half-Life?

Half-life is the amount of time it takes for half of a sample of a radioactive isotope to decay. In the context of the penny lab, the concept is metaphorically applied to understand how a certain process reduces the number of pennies or a simulated radioactive sample over time.

Relevance to Penny Experiments

Although pennies are not radioactive, they can be used in experiments to simulate decay processes by applying certain procedures, such as removing a fixed percentage of pennies at regular intervals or observing the deterioration over time.

Setting Up the Penny Half-Life Lab

Materials Needed

- Sample of pennies (preferably a large initial quantity)
- Marker or pen

- Timer or stopwatch
- Data recording sheet
- Calculator

Procedure Overview

- Start with a known number of pennies, record the initial count.
- At regular time intervals, remove a fixed percentage (commonly 50%) of the pennies or simulate decay by other means.
- Record the remaining number of pennies after each interval.
- Repeat until the number of pennies approaches zero or a predetermined number of intervals is completed.

Sample Data and Answer Key for Penny Half-Life Lab

Sample Data Table

Time (minutes)	Number of Pennies Remaining	Remaining Percentage	Logarithmic Value (log10)
0	100	100%	2
10	50	50%	1.69897
20	25	25%	1.39794
30	12	12%	1.07918
40	6	6%	0.77815
50	3	3%	0.47712

Calculating the Half-Life from Data

To determine the half-life from this data:

- Identify the time interval where the number of pennies halves. For example, from 100 to 50, then 50 to 25, etc.
- In the sample data, the half-life is approximately 10 minutes because the number of pennies drops from 100 to 50 in 10 minutes.

Answer Key Summary

- **Initial number of pennies:** 100
- **Half-life (time for number of pennies to reduce by half):** Approximately 10 minutes
- **Decay pattern:** Exponential, as observed from the data and the logarithmic calculations
- **Mathematical model:** The decay can be modeled using the formula $N(t) = N_0 (1/2)^{(t / T_{1/2})}$, where $N(t)$ is the remaining pennies at time t , N_0 is the initial count, and $T_{1/2}$ is the half-life.

Using the Answer Key to Understand the Data

Plotting the Data

Plotting the number of remaining pennies against time can visually demonstrate exponential decay. A semi-logarithmic graph (logarithmic scale on the y-axis) will produce a straight line, confirming the exponential nature.

Interpreting the Slope

The slope of the line in a semi-log plot relates to the decay constant. A steeper slope indicates a faster decay, thus a shorter half-life.

Calculating the Half-Life Mathematically

Given the logarithmic data:

- Use two data points to find the decay constant (k):

$$k = (\log N_1 - \log N_2) / (t_1 - t_2)$$

- Then, compute the half-life using:

$$T_{1/2} = \log(2) / k$$

This method provides a precise calculation of the half-life based on experimental data.

Tips for Success with the Penny Half-Life Lab

Accurate Data Collection

Ensure measurements are consistent and precise. Use the same intervals and methodology throughout the experiment to minimize errors.

Understanding Logarithmic Calculations

Familiarize yourself with logarithm properties, as they are essential for analyzing decay data and calculating decay constants.

Common Mistakes to Avoid

- Incorrectly recording data points
- Miscalculating logarithmic values
- Using inconsistent time intervals
- Ignoring the exponential nature of decay in data interpretation

Understanding the Half-Life Lab with Pennies

What Is the Half-Life Lab?

The half-life lab with pennies is an educational experiment designed to simulate the decay process of radioactive isotopes. Unlike real radioactive materials, pennies serve as a safe, accessible, and visual stand-in to model how an unstable nucleus decreases over time.

Objective:

To observe how the number of "radioactive" pennies decreases over successive "half-lives," and to understand the concept of half-life ? the time it takes for half of the radioactive material to decay.

Setup Overview:

- Initial pennies: All pennies start in a "decay" state, often marked or separated to represent the "radioactive" sample.
- Decay process: In each time interval (representing one half-life), half of the remaining pennies are "decayed" or removed, mimicking radioactive decay.
- Observation: Students record the number of remaining pennies after each interval, plotting decay over time.

Why Use Pennies?

Pennies are practical for several reasons:

- Accessibility: Readily available and inexpensive.
- Visibility: Easy to count and handle.
- Safety: No hazards associated with radioactive substances.
- Tactile Learning: Facilitates hands-on interaction, reinforcing theoretical concepts.

 - Record: "After 2 half-lives, 25 pennies remain."
- Subsequent Halves:
 - Continue halving: 25 $\rightarrow$ 12 or 13 (depending on rounding).
 - Record each step.
- Calculating Decay Percentage:
 - After each half-life, the remaining pennies represent a 50% reduction.

- Data Consistency Check:
- Experimental data should closely follow an exponential decay curve.

Common Half-Life Gizmo Questions and Solutions

Understanding typical questions can prepare students to navigate the Gizmo effectively. Below are some frequently encountered problems along with detailed solutions.

Question 1: Calculating Remaining Radioactive Material

Problem:

A sample initially contains 100 grams of a radioactive isotope with a half-life of 10 hours. How much remains after 30 hours?

Solution:

The decay follows exponential decay formula:

$$N = N_0 \times \left(\frac{1}{2}\right)^{t / T_{1/2}}$$

Where:

- $(N_0 = 100)$ grams
- $(T_{1/2} = 10)$ hours
- $(t = 30)$ hours

Calculations:

$$\left[N = 100 \times \left(\frac{1}{2}\right)^{30/10} = 100 \times \left(\frac{1}{2}\right)^3 = 100 \times \frac{1}{8} = 12.5 \text{ grams} \right]$$

Answer:

12.5 grams of the isotope remain after 30 hours.

Question 2: Determining the Half-Life from Data

Problem:

A sample of a radioactive material decays from 80 grams to 20 grams in 24 hours. What is its half-life?

Solution:

The decay from 80g to 20g involves two half-lives:

$$\left[80 \rightarrow 40 \rightarrow 20 \right]$$

Number of half-lives: 2

Time for two half-lives: 24 hours

Therefore,

$$\left[T_{1/2} = \frac{24 \text{ hours}}{2} = 12 \text{ hours} \right]$$

Answer:

The half-life of the substance is 12 hours.

Question 3: Interpreting Decay Graphs

Problem:

Given a decay curve that shows the remaining amount of a substance over time, how can you estimate the half-life?

Solution:

Steps:

- Find the initial amount on the y-axis (N_0).
- Locate the point where the remaining amount is approximately half of N_0 .
- Trace horizontally from this point to meet the decay curve, then go vertically down to the x-axis.
- The corresponding time on the x-axis is an estimate of the half-life.

Tip:

Using gridlines or digital tools can improve accuracy.
