$$a = \frac{(30)^2 - (20)^2}{2 \times 500} = \frac{900 - 400}{1000} = \frac{500}{1000} = 0.5, \text{ m/s}^2$$

 $\backslash$

Step 4: Calculate Time Taken

Use the equation:

 $\backslash$

$$v = u + at$$

 $\backslash$

Solve for (t) :

 $\backslash$

$$t = \frac{v - u}{a} = \frac{30 - 20}{0.5} = \frac{10}{0.5} = 20, \text{ seconds}$$

 $\backslash$

Before diving into specific solutions, it's crucial to adopt a systematic approach:

- Read the Problem Carefully

- Identify what is given and what needs to be found.
- Highlight key data and physical quantities involved.
- Note any assumptions or approximations that can be made.

- Visualize the Situation

- Draw diagrams or sketches to conceptualize the problem.
- Label all relevant variables and angles.

- Break Down the Problem

- Divide the problem into manageable parts.
- Determine which principles (e.g., Newton's laws, conservation laws) apply at each stage.

- Choose Appropriate Equations

- Use fundamental physics equations suited to the problem.
- Remember to check units for consistency.

- Solve Step-by-Step

- Perform calculations carefully.
- Keep track of intermediate results and uncertainties.

- Verify the Results

- Assess whether the answer makes physical sense.
- Consider limiting cases to test the solution's validity.

Typical Problem Types in Oxford Physics At Work 2

The problems generally fall into categories such as:

- Kinematics and Dynamics: Motion of objects under various forces.
- Energy and Work: Conservation of energy, work-energy theorem.
- Electromagnetism: Fields, forces, and potentials.
- Thermodynamics: Heat transfer, efficiency calculations.
- Modern Physics: Quantum, nuclear phenomena within applied contexts.

Below, we analyze a representative problem, illustrating the solution process in detail.

Example Problem Breakdown: A Moving Car and Friction

Problem Statement (Hypothetical):

A car of mass 1200 kg accelerates from rest to a speed of 20 m/s over a distance of 500 meters. Assuming constant acceleration and that the only horizontal force doing work is kinetic friction with a coefficient of friction $\mu = 0.3$, calculate:

- The magnitude of the acceleration.
- The work done by friction during the acceleration.
- The power required at the moment the car reaches 20 m/s.

Step-by-Step Solution

Step 1: Identifying Known Data and Unknowns

Given:

- Mass, $m = 1200 \text{ kg}$
- Initial velocity, $u = 0 \text{ m/s}$
- Final velocity, $v = 20 \text{ m/s}$
- Distance, $s = 500 \text{ m}$
- Coefficient of kinetic friction, $\mu = 0.3$

To find:

- Acceleration, a
- Work done by friction, W_{friction}
- Power at $v = 20 \text{ m/s}$

Step 2: Calculating the Acceleration

Since the motion occurs over a known distance with initial and final velocities, use the kinematic equation:

$$v^2 = u^2 + 2as$$

Plugging in values:

$$(20)^2 = 0 + 2 a 500$$

$$400 = 1000a$$

$$a = 400 / 1000 = 0.4 \text{ m/s}^2$$

Result:

The car accelerates at 0.4 m/s^2 .

Step 3: Determining the Force of Friction

Friction force:

$$F_{\text{friction}} = ? \text{ N}$$

Since the surface is horizontal, the normal force N equals the weight:

$$N = m g = 1200 \text{ kg } 9.8 \text{ m/s}^2 = 11760 \text{ N}$$

Thus,

$$F_{\text{friction}} = 0.3 \cdot 11760 = 3528 \text{ N}$$

Step 4: Calculating the Work Done by Friction

Work done by friction (opposing motion):

$$W_{\text{friction}} = - F_{\text{friction}} s$$

$$W_{\text{friction}} = - 3528 \text{ N} \cdot 500 \text{ m} = - 1,764,000 \text{ Joules}$$

The negative sign indicates that friction opposes the motion, removing energy from the system.

Step 5: Calculating the Work-Energy

Total work done on the car:

The initial kinetic energy:

$$KE_{\text{initial}} = 0 \text{ (since at rest)}$$

The final kinetic energy:

$$KE_{\text{final}} = (1/2) m v^2 = 0.5 \cdot 1200 \cdot 400 = 240,000 \text{ Joules}$$

Since work done by friction reduces the energy available, the work done by the engine (or driving force) must compensate for both the increase in kinetic energy and the work lost to friction:

$$W_{\text{done by engine}} = KE_{\text{final}} - KE_{\text{initial}} + |W_{\text{friction}}|$$

Note that the work done by the engine must be positive enough to overcome friction and provide kinetic energy.

Step 6: Calculating Power at Final Velocity

Power is the rate at which work is done:

$$P = F_{\text{total}} v$$

Where F_{total} is the net force accelerating the car:

$$F_{\text{net}} = m a = 1200 \text{ kg } 0.4 \text{ m/s}^2 = 480 \text{ N}$$

The engine must exert a force (F_{engine}) overcoming friction and providing acceleration:

$$F_{\text{engine}} = F_{\text{friction}} + F_{\text{net}} = 3528 \text{ N} + 480 \text{ N} = 4008 \text{ N}$$

Power at the moment the car reaches 20 m/s:

$$P = F_{\text{engine}} v = 4008 \text{ N } 20 \text{ m/s} = 80,160 \text{ Watts or approximately } 80.2 \text{ kW}$$

This is the instantaneous power required to sustain the acceleration at that moment.

Key Takeaways and Tips

- Always identify what is given and what needs to be found.
- Use diagrams to visualize the physical situation.
- Apply relevant physics principles systematically.
- Keep track of units and conversions.
- Cross-check results with physical intuition (e.g., acceleration reasonable? Power feasible?).
