- **Install Supporting Tools:** Tools like AVRDUDE for command-line programming, and optional libraries or SDKs for specific peripherals.

Writing Your First AVR Microcontroller Program

Understanding the Basic Structure

An AVR program typically includes:

- Initialization code to set up input/output pins, timers, and communication protocols
- The main loop where the core logic runs repeatedly
- Interrupt Service Routines (ISRs) if needed for handling asynchronous events

Here's a simple example: blinking an LED connected to pin PB0 on an ATmega328.

Sample Code: Blinking an LED

```
``c

include

include

int main(void) {

// Set PB0 as output
```

```
DDRB |= (1
while (1) {

// Turn LED on

PORTB |= (1
_delay_ms(500);

// Turn LED off

PORTB &= ~(1
_delay_ms(500);

}

return 0;

}

...

```

This program initializes the pin, then enters an infinite loop toggling the LED every 500 milliseconds.

Compiling, Uploading, and Debugging

Compiling Your Code

AVR Studio provides built-in tools to compile your code:

- Write your code in C or Assembly within the IDE
- Use the build command to compile, which generates a HEX file

Uploading Your Program to the Microcontroller

Once compiled, you'll need to upload the HEX file to the microcontroller:

- Connect your programmer to the PC and microcontroller
- Use AVR Studio's "Device Programming" feature to select the target device

Advanced Features of AVR Programming

Using Interrupts

Interrupts allow your microcontroller to respond immediately to events such as button presses, sensor signals, or timer overflows.

- Configure interrupt vectors in your code
- Enable specific interrupt sources (e.g., external interrupts on INT0)
- Write ISR functions to handle events

Example: External interrupt on INT0 pin:

```
``c
include

ISR(INT0_vect) {

// Handle external interrupt

}

int main(void) {

// Configure INT0

EIMSK |= (1
```

```
EICRA |= (1
sei(); // Enable global interrupts

while (1) {

// Main loop

}

}

...

```

Using Timers and Counters

Timers facilitate precise time delays, pulse-width modulation (PWM), and event counting.

- Configure timer registers (e.g., TCCR0, TCCR1)
- Set compare match values for desired timing
- Use timer interrupts for asynchronous timing

Implementing PWM for Motor Control or LED Dimming

PWM allows controlling the power delivered to devices:

```
```c

// Initialize Timer0 for Fast PWM mode

TCCR0 |= (1
OCR0 = 128; // 50% duty cycle

DDRB |= (1
...

```
