Understanding Solutions Molarity and Dilution

What Is Molarity?

Molarity (denoted as M) is a measure of concentration that expresses the number of moles of solute dissolved in one liter of solution. It is a standard unit used in chemistry to quantify how much solute is present in a given volume of solvent.

Key Points about Molarity:

- Molarity = Moles of solute / Volume of solution in liters
- It helps in preparing solutions with precise concentrations.
- Molarity is temperature-dependent because volume can expand or contract with temperature changes.

Understanding Dilution

Dilution involves reducing the concentration of a solute in a solution by adding more solvent without changing the amount of solute. It is a common laboratory procedure to prepare solutions of desired concentrations from more concentrated stock solutions.

Key Points about Dilution:

- The process involves adding solvent to decrease molarity.

- The relationship between concentrations and volumes before and after dilution is given by the dilution formula:

$$C_1V_1 = C_2V_2$$

where:

- C_1 = initial concentration
- V_1 = initial volume
- C_2 = final concentration
- V_2 = final volume

Common Practice Problems with Solutions and Answer Keys

Practice Problem 1: Calculating Molarity from Mass

Question:

What is the molarity of a solution prepared by dissolving 5.0 grams of sodium chloride (NaCl) in enough water to make 250 mL of solution? (Molar mass of NaCl = 58.44 g/mol)

Solution:

- Convert grams of NaCl to moles:

$$\text{Moles} = \frac{5.0 \text{ g}}{58.44 \text{ g/mol}} \approx 0.0855 \text{ mol}$$

- Convert volume to liters:

$$250 \text{ mL} = 0.250 \text{ L}$$

- Calculate molarity:

$$M = \frac{0.0855 \text{ mol}}{0.250 \text{ L}} = 0.342 \text{ M}$$

Answer:

The molarity of the NaCl solution is approximately 0.342 M.

Practice Problem 2: Diluting a Solution

Question:

A 2.0 M sodium hydroxide (NaOH) solution is diluted to 0.50 M. If the final volume of the diluted solution is 2.0 liters, what was the original volume of the stock solution used?

Solution:

Using the dilution formula:

$$C_1V_1 = C_2V_2$$

Plug in the known values:

$$2.0\text{ M} \times V_1 = 0.50\text{ M} \times 2.0\text{ L}$$

Calculate V_1 :

$$V_1 = \frac{0.50 \times 2.0}{2.0} = 0.50\text{ L}$$

Answer:

The original volume of the 2.0 M NaOH solution was 0.50 liters (or 500 mL).

Practice Problem 3: Preparing a Solution of Desired Molarity

Question:

How much solid potassium permanganate (KMnO₄) must be dissolved in water to prepare 1 liter of a 0.01 M solution? (Molar mass of KMnO₄ = 158.04 g/mol)

Solution:

- Determine moles needed:

$$\text{Moles} = 0.01\text{ mol/L} \times 1\text{ L} = 0.01\text{ mol}$$

- Convert moles to grams:

$$\text{Mass} = 0.01 \text{ mol} \times 158.04 \text{ g/mol} = 1.5804 \text{ g}$$

Answer:

Dissolve approximately 1.58 grams of KMnO_4 in water to make 1 liter of 0.01 M solution.

Understanding Solutions, Molarity, and Dilution

Before delving into practice answer keys, it's crucial to understand the core concepts of solutions, molarity, and dilution.

Solutions in Chemistry

Solutions are homogeneous mixtures composed of a solvent and one or more solutes. The solvent is the component present in the largest amount, typically water in aqueous solutions, while the

solutes are substances dissolved in the solvent. Achieving the correct concentration of a solution is essential for consistent experimental results.

Molarity (M)

Molarity is a measure of concentration expressed as moles of solute per liter of solution. It's a standard unit in chemistry that facilitates precise communication of solution strength. The formula for molarity is:

$$M = \frac{\text{moles of solute}}{\text{liters of solution}}$$

Understanding how to calculate and manipulate molarity is fundamental for preparing solutions and performing titrations.

Dilution of Solutions

Dilution involves reducing the concentration of a solution by adding solvent, usually water, without altering the amount of solute. The key relationship governing dilution is:

$$M_1 V_1 = M_2 V_2$$

where:

- M_1 and V_1 are the molarity and volume of the initial concentrated solution.
- M_2 and V_2 are the molarity and volume after dilution.

Mastering dilution calculations allows chemists to prepare solutions of desired concentrations efficiently.
