Stapled Transanal Rectal Resection with Contour T: An In-Depth Overview

Introduction

Chronic constipation, obstructed defecation syndrome (ODS), and internal rectal prolapse are common anorectal conditions that significantly impair quality of life. Over the years, minimally invasive surgical techniques have evolved to address these issues effectively, prioritizing patient comfort, reduced recovery time, and improved functional outcomes. Among these, Stapled Transanal Rectal Resection (STARR) has emerged as a pivotal procedure, especially with the development of advanced stapling devices like the Contour T.

This article offers a comprehensive review of STARR with Contour T, exploring its principles, procedural nuances, benefits, limitations, and the current evidence supporting its use. Whether you're a colorectal surgeon, a resident, or a patient considering surgical options, this detailed insight aims to clarify why this technique has garnered attention in the field of anorectal surgery.

Understanding the Need for Stapled Transanal Rectal Resection

The Pathophysiology of Obstructed Defecation

Obstructed defecation syndrome (ODS) manifests as difficulty in stool evacuation, often

accompanied by straining, incomplete evacuation, and the need for digital maneuvers. The underlying causes are multifactorial, including:

- Rectal prolapse or intussusception: Internal or external protrusion of rectal tissue.
- Rectocele: Bulging of the rectal wall into the vagina.
- Dyssynergic defecation: Dysfunctional pelvic floor muscle coordination.
- Anatomical abnormalities: Such as redundant rectal segments or internal mucosal prolapse.

Among these, internal rectal prolapse and rectal intussusception are primary targets for surgical correction, as they directly contribute to the obstructive symptoms.

The Rationale Behind Stapled Transanal Rectal Resection (STARR)

Traditional surgical options for internal rectal prolapse included rectopexy, perineal procedures, and mucosal resections. While effective, these procedures often involved open surgery, higher morbidity, or less precise tissue removal.

STARR emerged as a minimally invasive, transanal technique that combines the principles of mucosal resection with stapling technology to:

- Resect redundant rectal tissue causing prolapse or intussusception.
- Reinforce rectal wall integrity.
- Restore normal anorectal anatomy, thereby alleviating obstructive symptoms.

The procedure is performed entirely through the anal canal, avoiding abdominal incisions, which results in less postoperative pain, faster recovery, and reduced hospital stays.

Introducing the Contour T Stapler

Design and Features

The Contour T is a specialized circular stapler designed explicitly for transanal rectal procedures. Its key features include:

- Anatomically contoured shape: Designed to conform to the rectal lumen, facilitating precise tissue capture.
- Multiple firing options (up to three): Allows for tailored resections, especially in complex or elongated rectal prolapse cases.

- Enhanced tissue compression: Ensures secure staple formation and minimizes bleeding.
- Integrated cutting and stapling mechanism: Enables simultaneous resection and closure.
- Adjustable staple height: Accommodates varying tissue thicknesses, optimizing staple line integrity.

Advantages Over Traditional Staplers

Compared to earlier models, the Contour T provides:

- Better conformability to rectal anatomy.
- Increased flexibility for complex resections.
- Reduced risk of staple line failure.
- Improved surgeon ergonomics and ease of use.

Procedural Technique: Step-by-Step Overview

Preoperative Preparation

- Patient evaluation: Assessment includes anorectal manometry, defecography, and endoscopy.
- Bowel prep: Standard laxative regimen to clear the rectum.
- Informed consent: Discussion of risks, benefits, and alternatives.

Surgical Steps

- Patient positioning: Usually in lithotomy or prone jackknife position.
- Anorectal examination: Digital and anoscopic assessment to determine the extent of prolapse.
- Insertion of anoscope and visualization: Ensures accurate targeting of the redundant tissue.
- Identification of resection margins: Usually 2-4 cm above the dentate line, depending on the prolapse's extent.
- Tissue grasping: The surgeon uses the Contour T stapler to engage the redundant rectal wall, ensuring inclusion of the prolapsed segment.
- First firing: The stapler is fired to resect the targeted tissue, with the device's design allowing for subsequent firings if needed.
- Additional resections: If necessary, the surgeon can perform up to three sequential firings to remove elongated or multiple prolapsed segments.
- Hemostasis and inspection: Careful examination of the staple line to ensure hemostasis and integrity.
- Postoperative management: Patients are monitored for bleeding, pain, and bowel function.

Clinical Benefits of STARR with Contour T

Symptom Relief and Functional Outcomes

- Reduction in obstructed defecation symptoms: Patients often report significant improvement in straining, sensation of incomplete evacuation, and need for digital maneuvers.
- Anorectal anatomy restoration: Imaging studies post-procedure show decreased rectal prolapse or intussusception.
- Enhanced quality of life: Many patients experience sustained symptom relief, translating into better daily functioning.

Advantages of the Technique and Device

- Minimally invasive approach: No abdominal incisions, leading to less postoperative pain.
- Precision tissue removal: The Contour T's design allows for targeted resection, minimizing unnecessary tissue loss.
- Reduced operative time: Streamlined steps with the device's ease of use.
- Lower complication rates: Secure staple formation reduces bleeding and postoperative complications like pain or stenosis.
