Hess's Law states that the total enthalpy change for a reaction is the same, regardless of the pathway taken, allowing calculation of enthalpy changes through multiple steps. What is the difference between exothermic and endothermic reactions? Exothermic reactions release heat to the surroundings, resulting in a negative ΔH , while endothermic reactions absorb heat, resulting in a positive ΔH . What is standard enthalpy of formation (ΔH°_f)? It is the change in enthalpy when one mole of a compound is formed from its elements in their standard states under standard conditions. How is heat capacity related to calorimetry experiments? Heat capacity is the amount of heat required to raise the temperature of a substance by one degree; it is used in calorimetry to determine the heat exchanged during reactions. What are the common units used in thermochemistry calculations? Common units include joules (J), kilojoules (kJ), calories (cal), and kilocalories (kcal), depending on the context of the measurements.
