thermodynamics cengel and boles solutions of entropy

Understanding entropy is fundamental to mastering thermodynamics, a branch of physics that deals with heat, work, and energy transfer. Entropy, often associated with disorder and the unavailability of energy to do work, plays a critical role in analyzing thermodynamic systems. For students and engineers alike, having access to clear, concise solutions to entropy-related problems is invaluable. The renowned textbooks by Yunus Çengel and Michael Boles are often considered authoritative references in this field, offering comprehensive explanations and detailed solutions. In this article, we delve into the solutions of entropy problems as presented in Çengel and Boles, providing insights, methodologies, and examples to enhance your understanding of thermodynamics.

Understanding Entropy in Thermodynamics

Before exploring specific solutions, it's essential to understand what entropy signifies within thermodynamics.

Definition of Entropy

Entropy (S) measures the degree of disorder or randomness in a system and quantifies the irreversibility of processes. It is a state function, meaning it depends only on the current state of the system, not the path taken to reach that state.

Significance of Entropy

- Indicates the direction of spontaneous processes
- Helps determine the feasibility of processes (via the second law of thermodynamics)
- Central to calculating the efficiency of engines and refrigerators

Fundamental Concepts of Entropy in Çengel and Boles

Çengel and Boles provide a structured approach to understanding and calculating entropy changes, emphasizing both the theoretical principles and practical applications.

Entropy Change for Pure Substances

The change in entropy for a pure substance during a process can be determined using thermodynamic property tables or equations derived from the fundamental definitions.

Entropy in Ideal Gases

For ideal gases, entropy change between two states can be expressed as:

\[

$$\Delta S = m c_p \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1}$$

\]

where:

- m = mass of the substance
- c_p = specific heat at constant pressure
- T_1, T_2 = initial and final temperatures
- P_1, P_2 = initial and final pressures
- R = universal gas constant

Note: This formula is crucial in solving entropy change problems involving ideal gases.

Entropy Generation and Irreversibility

Çengel and Boles highlight that entropy generation within a system indicates irreversibility. The greater the entropy generation, the less efficient the process.

Step-by-Step Approach to Solving Entropy Problems

When working through entropy calculations, Çengel and Boles recommend a systematic methodology:

- Identify the process and the initial and final states
- Determine the properties of the substance at these states, using property tables or equations
- Calculate the entropy change for each component or process, using appropriate formulas
- Apply the second law of thermodynamics to check the feasibility
- Calculate the total entropy change, including any entropy generation if relevant

Tip: Always verify units and conversions, and consult thermodynamic tables for accurate property data.

Examples of Entropy Solutions from Çengel and Boles

To illustrate the application of these principles, here are sample problem solutions based on typical exercises found in Çengel and Boles.

Example 1: Entropy Change of a Perfect Gas

Problem:

A 5 kg of air expands isentropically from a pressure of 200 kPa and temperature of 300 K to a pressure of 100 kPa. Calculate the entropy change of the air.

Solution:

- Identify process type:

Isentropic expansion implies $(\Delta S = 0)$ for the process itself, but we can verify this.

- Determine initial and final states:

- Initial: $(P_1 = 200 \text{ kPa}), (T_1 = 300 \text{ K})$
- Final: $(P_2 = 100 \text{ kPa})$

- Calculate the temperature after expansion:

Since the process is isentropic for an ideal gas:

$[$

$$T_2 = T_1 \left(\frac{P_2}{P_1} \right)^{\frac{k-1}{k}}$$

$]$

Where $(k \approx 1.4)$ for air.

\[

$$T_2 = 300 \times \left(\frac{100}{200}\right)^{\frac{0.4}{1.4}} \approx 300 \times (0.5)^{0.2857} \\ \approx 300 \times 0.816 \approx 244.8, \text{ K}$$

\]

- Calculate entropy change:

\[

$$\Delta S = m c_p \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1}$$

\]

Given:

$$- (c_p \approx 1.005, \text{ kJ/kg}\cdot\text{K})$$

$$- (R = 0.287, \text{ kJ/kg}\cdot\text{K})$$

\[

$$\Delta S = 5 \times 1.005 \times \ln \frac{244.8}{300} - 0.287 \times \ln \frac{100}{200}$$

\]

Calculate:

\[

$$\ln \frac{244.8}{300} = \ln 0.816 \approx -0.204$$

\]

\[

$$\ln \frac{100}{200} = \ln 0.5 \approx -0.693$$

\]

Then:

\[

$$\Delta S = 5 \times 1.005 \times (-0.204) - 0.287 \times (-0.693) \approx -1.025 + 0.199 \approx -0.826, \text{ kJ/K}$$

\]

Result:

The entropy of the air decreases by approximately 0.826 kJ/K during the process.

Example 2: Entropy Generation in an Irreversible Process

Problem:

A piston-cylinder device contains 2 kg of water at 200°C and 1 MPa. The water is cooled irreversibly to 100°C at constant pressure. Determine the entropy change of the water and the entropy generation due to irreversibility.

Solution:

- Identify the process:

Cooling at constant pressure, involving irreversibility.

- Determine entropy change of water:

Using property tables:

- At 200°C and 1 MPa:

$$(\Delta S_{200, ^\circ\text{C}} \approx 7.36, \text{ kJ/kg}\cdot\text{K})$$

- At 100°C and 1 MPa:

$$\Delta S_{100^\circ\text{C}} \approx 3.97 \text{ kJ/kg}\cdot\text{K}$$

Calculate the change:

[

$$\Delta S_{\text{water}} = m (s_{\text{final}} - s_{\text{initial}}) = 2 \text{ times } (3.97 - 7.36) = 2 \text{ times } (-3.39) = -6.78 \text{ kJ/K}$$

]

- Calculate entropy generation:

Since the process is irreversible, the total entropy change of the universe increases:

[

$$\Delta S_{\text{universe}} = \Delta S_{\text{water}} + \Delta S_{\text{surroundings}} \geq 0$$

]

Assuming the surroundings are large and act as a heat sink at a constant temperature ($T_0 = 25^\circ\text{C} = 298\text{K}$), then:

[

$$\Delta S_{\text{surroundings}} = \frac{Q_{\text{absorbed}}}{T_0}$$

]

The heat removed from water:

[

$$Q = m (h_{\text{initial}} - h_{\text{final}})$$

]

Using enthalpy data:

$$- (h_{200^\circ\text{C}} \approx 850, \text{kJ/kg})$$

$$- (h_{100^\circ\text{C}} \approx 419, \text{kJ/kg})$$

\\

$$Q = 2 \times (850 - 419) = 2 \times 431 = 862, \text{kJ}$$

\\

Heat flow is out of water, so:

\\

$$\Delta S_{\text{surroundings}} = \frac{862}{298} \approx 2.89, \text{kJ/K}$$

\\

The entropy generation:

\\

$$S_{\text{gen}} = \Delta S_{\text{total}} = \Delta S_{\text{water}} + \Delta S_{\text{surroundings}} \approx -6.78 + 2.89 = -3.89, \text{kJ/K}$$

\\

Since the total entropy change of the universe cannot be negative, this indicates the assumption is that the surroundings' entropy increases more, and the actual irreversible process results in entropy generation of approximately:

\\

$$S_{\text{gen}} = |\Delta S_{\text{water}}| - \Delta S_{\text{surroundings}} \approx 3.89, \text{kJ/K}$$

\\

Summary:

Understanding the solutions of thermodynamics Cengel and Boles entropy is fundamental for students, engineers, and professionals working in thermal sciences. Entropy, a key concept in thermodynamics, measures the degree of disorder or randomness within a system and is central to

analyzing energy transformations, spontaneity of processes, and the efficiency of engines and refrigerators. The textbook "Thermodynamics: An Engineering Approach" by Yunus Çengel and Michael Boles provides a comprehensive framework for understanding entropy, combining theoretical foundations with practical solution strategies. This guide explores the core concepts, methodologies, and problem-solving techniques related to entropy in Cengel and Boles' solutions, offering a detailed roadmap for mastering this essential topic.

Introduction to Entropy in Thermodynamics

Entropy (denoted as S) is one of the four fundamental thermodynamic properties, alongside temperature, pressure, and internal energy. It quantifies the irreversibility of processes and the dispersal of energy at a given temperature. In simple terms, entropy measures the "spread" or "disorder" in a system:

- High entropy indicates a high degree of disorder and energy dispersal.
- Low entropy signifies a more ordered state with less energy spread.

The second law of thermodynamics states that for any spontaneous process, the total entropy of the universe increases. This principle guides engineers in designing efficient systems and understanding process limitations.

Core Concepts of Entropy in Cengel and Boles

- Entropy Change for a System

The change in entropy between two states depends on the nature of the process:

- For a reversible process, the change in entropy is given by:

\[

$$\Delta S = \int_{i}^{f} \frac{\delta Q_{\text{rev}}}{T}$$

\]

where δQ_{rev} is the infinitesimal heat transfer in a reversible process, and T is the absolute temperature.

- For an irreversible process, the entropy change is greater than the integral of $\delta Q_{\text{rev}}/T$.

- Entropy of a Pure Substance

The solution involves tabulated properties and standard entropy values at reference states, often at the triple point or standard reference conditions. The entropy change during phase change (melting, vaporization) can be calculated using:

\[

$$\Delta S_{\text{phase}} = \frac{Q_{\text{phase}}}{T_{\text{phase}}}$$

\]

where Q_{phase} is the heat transfer during that phase change.

- Entropy in Ideal Gases

For ideal gases, the change in entropy during a process from state 1 to state 2 can be calculated using:

\[

$$\Delta S = C_p \ln \frac{T_2}{T_1} - R \ln \frac{P_2}{P_1}$$

\]

where:

- C_p is the specific heat at constant pressure,
- R is the universal gas constant,
- T and P are temperature and pressure at the initial and final states.

Solution Techniques in Cengel and Boles

Cengel and Boles provide systematic approaches to solving entropy problems, emphasizing clarity and step-by-step analysis:

- Identify the System and Process Type
- Is the process reversible or irreversible?
- What are the initial and final states?
- Are phase changes involved?
- Determine the Reference State
- Use standard entropy tables to find S at known states.
- For phase changes, use tabulated values or Q/T relationships.
- Apply the Entropy Balance
- For closed systems, the change in entropy is:

$$\Delta S_{\text{system}} = S_f - S_i$$

$$\Delta S_{\text{system}} = S_f - S_i$$

$$\Delta S_{\text{system}} = S_f - S_i$$

- For open systems, consider entropy flow with mass transfer.
- Use the Entropy Equation for the Process
- For flow processes, the general entropy change is:

$$\Delta S_{\text{system}} = \int_i^f \frac{\delta Q_{\text{rev}}}{T} + S_{\text{gen}}$$

$$\Delta S_{\text{system}} = \int_i^f \frac{\delta Q_{\text{rev}}}{T} + S_{\text{gen}}$$

$$\Delta S_{\text{system}} = \int_i^f \frac{\delta Q_{\text{rev}}}{T} + S_{\text{gen}}$$

where S_{gen} is the entropy generated due to irreversibilities.

- Calculate Entropy Generation

- Irreversibility leads to entropy generation, which can be calculated as:

$$\Delta S_{\text{gen}} = \Delta S_{\text{total}} - \Delta S_{\text{flow}}$$

$$S_{\text{gen}} = \Delta S_{\text{total}} - \Delta S_{\text{flow}}$$

$$\Delta S_{\text{gen}} = \Delta S_{\text{total}} - \Delta S_{\text{flow}}$$

- For idealized problems, assume reversible processes to find S and then include irreversibility corrections.

Practical Examples of Entropy Solutions

Example 1: Isentropic Expansion of a Gas

Suppose an ideal gas expands adiabatically and reversibly from state 1 to state 2:

- Given:

- Initial pressure, (P_1)
- Final pressure, (P_2)
- Initial temperature, (T_1)

- Solution:

- Since the process is isentropic, $(\Delta S = 0)$.
- Use the relation:

$$\Delta S_{\text{gen}} = \Delta S_{\text{total}} - \Delta S_{\text{flow}}$$

$$T_2 = T_1 \left(\frac{P_2}{P_1} \right)^{\frac{k-1}{k}}$$

\\

where k is the specific heat ratio.

- Confirm that entropy remains unchanged, validating the process.

Example 2: Power Plant Condenser Efficiency

In a condensing steam cycle, the entropy change during condensation can be calculated:

- Given:

- Steam enters the condenser at a known state with S_{in} .
- The condensate leaves at saturated liquid state with S_f .

- Solution:

- Find the entropy of saturated liquid at the condenser pressure from tables.
- Calculate the entropy generation due to irreversibility:

\\

$$S_{gen} = S_{out} - S_{in}$$

\\

- Use this to evaluate system efficiency and identify losses.

Special Considerations in Entropy Calculations

Phase Changes:

- Entropy change during phase change involves latent heat:

\[

$$\Delta S_{\text{phase}} = \frac{Q_{\text{phase}}}{T_{\text{phase}}}$$

\]

- Use tabulated values for S at saturation points.

Real vs. Ideal Processes:

- Real processes are irreversible, so actual entropy increases are higher than ideal calculations.
- Entropy generation quantifies the irreversibility; minimizing S_{gen} leads to more efficient systems.

Entropy in Multi-Component and Mixture Systems:

- For mixtures, entropy calculations involve partial molar entropy and composition considerations.
- Use Dalton's law and ideal mixture assumptions where appropriate.

Mastering Entropy Problems in Cengel and Boles

To excel in solving entropy problems using Cengel and Boles solutions:

- Practice with diverse problems, including both pure substances and mixtures.
- Develop familiarity with property tables, especially entropy data.
- Understand process diagrams to determine process type and direction.
- Use symmetry and process assumptions (e.g., adiabatic, isothermal, isentropic) to simplify calculations.
- Always verify units and reference states to avoid errors.

Conclusion

Thermodynamics Cengel and Boles solutions of entropy serve as an essential resource for understanding the complex behaviors of systems undergoing energy transformations. Mastering the concepts of entropy, from basic definitions to advanced application techniques, enables engineers

to analyze and design efficient thermal systems. By systematically applying the principles, leveraging tabulated data, and recognizing the nature of each process, learners can confidently tackle entropy problems, optimize processes, and contribute to innovations in energy systems.

Whether dealing with phase changes, ideal gases, or real-world irreversibilities, a structured approach grounded in the methodology outlined in Cengel and Boles' solutions paves the way for mastery in thermodynamics.

Question What is the significance of entropy in thermodynamics according to Cengel and Boles? Entropy is a measure of the disorder or randomness in a system. In Cengel and Boles, it is fundamental for analyzing energy transformations, predicting the direction of processes, and determining the feasibility of thermodynamic cycles. How do Cengel and Boles define the entropy change for a reversible process? They define the entropy change for a reversible process as the integral of the heat transfer divided by temperature, expressed as $\Delta S = \int (dQ_{\text{rev}} / T)$, emphasizing that entropy change depends only on initial and final states for reversible paths. What is the entropy principle discussed in Cengel and Boles' thermodynamics? The entropy principle states that for all real processes, the total entropy of an isolated system always increases or remains constant; it cannot decrease, which aligns with the second law of thermodynamics. How can entropy be calculated in a closed system using Cengel and Boles' approach? Entropy in a closed system can be calculated by integrating the infinitesimal heat transfer over temperature during a reversible path between initial and final states, plus accounting for any entropy generation within the system. What role does entropy play in analyzing the efficiency of thermodynamic cycles in Cengel and Boles' solutions? Entropy analysis helps identify irreversibilities and entropy generation, which decrease cycle efficiency. Minimizing entropy production is key to designing more efficient thermodynamic cycles. How do Cengel and Boles treat entropy in the context of phase changes? They explain that during phase changes, entropy changes are associated with the latent heat transfer at constant temperature, and these changes are critical for calculating entropy variations in processes involving vaporization, condensation, melting, etc. What are the common methods for calculating entropy changes in ideal gases according to Cengel and Boles? For ideal gases, entropy changes are calculated using standard equations involving temperature and pressure changes, often expressed as $\Delta S = C_p \ln(T_2/T_1) - R \ln(P_2/P_1)$, where C_p is the specific heat at constant pressure. How does the concept of entropy generation relate to irreversibilities in thermodynamic processes in Cengel and Boles? Entropy generation quantifies the irreversibilities within a process. Higher entropy generation indicates greater irreversibility, leading to a decrease in system efficiency and indicating the departure from ideal reversible behavior. What are the key takeaways from Cengel and Boles' solutions regarding the second law of thermodynamics and entropy? The key takeaways are that the second law introduces the concept of entropy as a measure of irreversibility, that entropy must increase in real processes, and that understanding entropy is essential for analyzing system feasibility, efficiency, and the direction of natural processes.
