2. Meshing the Geometry

Meshing converts the geometry into a finite number of elements for numerical analysis.

Key points:

- Use ANSYS Meshing tools or external meshing software compatible with ANSYS.
- Choose appropriate mesh types (tetrahedral, hexahedral, polyhedral).
- Refine the mesh in areas with expected high gradients (e.g., near walls, in wakes).

Steps for meshing in ANSYS:

- Import geometry into the Mechanical or Meshing module.
- Define mesh settings based on problem complexity.
- Generate the mesh and check for quality metrics.
- Perform mesh independence studies to ensure accuracy.

3. Setting Up the CFX Analysis

Key components:

- Define the analysis type (steady-state or transient).
- Specify boundary conditions: inlets, outlets, walls, symmetry planes.
- Assign material properties: fluid type, density, viscosity.
- Choose turbulence models (e.g., k-epsilon, k-omega, SST).
- Set initial conditions and solver controls.

Example boundary conditions:

- Inlet velocity or pressure
- Outlet pressure or mass flow
- Wall conditions: no-slip, slip, or specified heat flux

4. Configuring Solver Settings

Proper solver setup ensures convergence and accuracy.

Important parameters:

- Convergence criteria (residual thresholds)
- Under-relaxation factors
- Time step (for transient simulations)
- Number of iterations or time steps

Monitor residuals and key variables during the run to assess convergence.
