Designing Multiagent System Architecture in MATLAB

Agent Representation

In MATLAB, agents can be represented as structures, objects, or classes, encapsulating properties and behaviors. For example:

```
```matlab
```

```
classdef Agent
```

```
properties
```

```
id
```

```
position
```

```
velocity
```

```
state
```

```
communicationRange
```

```
end
```

methods

```
function obj = Agent(id, position)
```

```
obj.id = id;
```

```
obj.position = position;
```

```
obj.velocity = [0,0];
```

```
obj.state = 'idle';
```

```
obj.communicationRange = 10; % example value
```

```
end
```

```
function obj = move(obj, targetPosition)
```

```
% Simple movement towards target
```

```
direction = targetPosition - obj.position;
```

```
speed = 1; % units per timestep
```

```
if norm(direction) > 0
```

```
obj.velocity = (direction / norm(direction)) speed;
```

```
obj.position = obj.position + obj.velocity;
```

```
end
```

```
end
```

```
end
```

```
end
```

```
...
```

This class encapsulates the core properties and behaviors of an agent, facilitating scalable system

design.

## Initializing Multiple Agents

To create a multiagent system, initialize an array of agent objects:

```
```matlab

numAgents = 5;

agents = repmat(Agent(0, [0,0]), numAgents, 1);

for i = 1:numAgents

    startPos = rand(1,2) * 100; % random positions in 100x100 space

    agents(i) = Agent(i, startPos);

end

```
```

This setup provides a flexible way to manage multiple agents within the MATLAB environment.

## Communication Protocols in MATLAB Multiagent Systems

### Implementing Agent Communication

Effective communication is vital for coordinated behavior. In MATLAB, communication can be modeled via message passing using data structures, or by shared variables in a simulation loop.

Example: Message Structure

```
```matlab

message = struct('senderID', 1, 'receiverID', 3, 'content', 'moveTo', 'target', [50,50]);

```
```

Message Passing Loop

```
```matlab

messages = [];

for i = 1:numAgents

    for j = 1:numAgents

        if i ~= j

            if norm(agents(i).position - agents(j).position) < threshold
                % Send message

                messages(end+1) = struct('senderID', i, 'receiverID', j, 'content', 'moveTo', 'target', rand(1,2)100);

            end

        end

    end

end

end

```
```

This simple approach allows agents to communicate based on proximity or other criteria.

## Communication Optimization

For large systems, consider:

- Using message queues.
- Applying event-driven communication.
- Employing MATLAB's parallel computing features to handle concurrent message passing.

## Coordination Strategies and Algorithms

### Consensus Algorithms

Consensus algorithms enable agents to agree on certain variables, such as formation position or

shared objectives.

Simple Average Consensus Example:

```
```matlab

for t = 1:50

for i = 1:numAgents

neighborIDs = findNeighbors(agents(i), agents, communicationRange);

neighborStates = [agents(neighborIDs).position];

agents(i).position = mean([agents(i).position; neighborStates], 1);

end

end

```
```

This iterative process helps agents reach an agreement based on their neighbors' states.

## Distributed Optimization

Multiagent systems often optimize collective performance using algorithms like Distributed Gradient Descent or Particle Swarm Optimization (PSO).

Example: PSO in MATLAB

```
```matlab

% Define particles

particles = rand(10,2) * 100; % 10 particles in 2D space

velocities = zeros(size(particles));

for iter = 1:100
```

```
% Update positions based on velocities

particles = particles + velocities;

% Update velocities based on personal and global best

% (Implementation details omitted for brevity)

end

...

```

Such algorithms are highly adaptable within MATLAB's environment.

Practical MATLAB Code Examples for Multiagent Systems

Example 1: Simple Multiagent Navigation

```
```matlab

% Number of agents

numAgents = 10;

% Initialize agents

agents = repmat(Agent(0, [0,0]), numAgents, 1);

for i = 1:numAgents

agents(i) = Agent(i, rand(1,2) 100);

end

% Target for agents

target = [50, 50];

% Simulation loop

for t = 1:100

```

```
for i = 1:numAgents

agents(i) = agents(i).move(target);

end

% Visualization

figure(1); clf; hold on;

for i = 1:numAgents

plot(agents(i).position(1), agents(i).position(2), 'bo');

end

plot(target(1), target(2), 'r', 'MarkerSize', 10);

xlim([0, 100]);

ylim([0, 100]);

pause(0.1);

end

...

```

This code demonstrates basic agent movement towards a target with visualization.

## Example 2: Formation Control

Implementing formation control involves positioning agents relative to each other, often using consensus or potential fields techniques.

```
```matlab

% Define desired formation positions

formationPositions = [0,0; 1,0; 1,1; 0,1];

```

```
% Initialize agents

agents = initializeAgentsInFormation(formationPositions);

% Control loop

for t = 1:100

    for i = 1:length(agents)

        % Calculate error to desired formation position

        error = formationPositions(i,:) - agents(i).position;

        % Update agent position

        agents(i).move(agents(i).position + 0.1 * error);

    end

    % Visualization code omitted for brevity

end

'''
```

This approach maintains formation through distributed control.

Yes, MATLAB supports interfacing with other platforms through APIs, MATLAB Engine APIs, or exporting code to C/C++, Python, or Java, enabling integration of MATLAB multi-agent models with external systems or simulation environments. How do I implement decision-making algorithms in MATLAB for multi-agent systems? Decision-making algorithms can be implemented within agent classes or functions, using logic, state machines, or AI techniques like fuzzy logic or neural networks, to enable agents to make autonomous choices based on their perceptions and goals.
