Question 2: Percentage Calculation

A shirt costs \$150. If the discount offered is 20%, what is the discounted price?

Solution:

$$\text{Discount} = 20\% \text{ of } 150 = 0.20 \times 150 = 30$$

$$\text{Discounted Price} = 150 - 30 = \$120$$

Answer: \$120

Question 3: Profit and Loss

A shopkeeper buys an article for \$500 and sells it for \$600. What is the profit percentage?

Solution:

$$\text{Profit} = \text{Selling Price} - \text{Cost Price} = 600 - 500 = \$100$$

$$\text{Profit Percentage} = (\text{Profit} / \text{Cost Price}) \times 100 = (100 / 500) \times 100 = 20\%$$

Answer: 20%

Solution:

$$CI = P(1 + r)^n - P$$

Where:

$$P = 1000$$

$$r = 0.05$$

$$n = 2$$

$$CI = 1000 (1 + 0.05)^2 - 1000 = 1000 (1.1025) - 1000 = 1102.50 - 1000 = \$102.50$$

Answer: \$102.50

Sample Exponential Word Problems with Solutions

Problem 1: Population Growth

A bacteria culture starts with 500 bacteria. The population doubles every 3 hours. How many bacteria will there be after 9 hours?

Solution:

Step 1: Identify knowns:

- Initial population $(a = 500)$
- Doubling every 3 hours, so the growth factor per hour:

Since it doubles every 3 hours:

$$b = 2^{\frac{1}{3}}$$

- Time $(x = 9)$ hours

Step 2: Write the exponential model:

$$y = a \times b^x$$

$$y = 500 \times \left(2^{\frac{1}{3}}\right)^9$$

Step 3: Simplify:

$$y = 500 \times 2^{\frac{1}{3} \times 9}$$

$$y = 500 \times 2^3$$

$$y = 500 \times 8$$

$$y = 4000$$

Answer: After 9 hours, there will be 4,000 bacteria.

Problem 2: Compound Interest

An investment of \$1,000 is made into an account that earns 5% annual compound interest. How much will the investment be worth after 10 years?

Solution:

Step 1: Recognize knowns:

- Principal $(a = 1000)$
- Annual interest rate $(r = 5\% = 0.05)$
- Number of years $(x = 10)$

- Compound interest formula:

$$y = a \times (1 + r)^x$$

Step 2: Plug in the values:

$$y = 1000 \times (1 + 0.05)^{10}$$

$$y = 1000 \times 1.05^{10}$$

Step 3: Calculate:

$$1.05^{10} \approx 1.6289$$

$$y \approx 1000 \times 1.6289$$

$$y \approx 1628.90$$

Answer: The investment will grow to approximately \$1,628.90 after 10 years.

Problem 3: Radioactive Decay

A sample of a radioactive isotope has a half-life of 8 hours. How much of a 100-gram sample remains after 24 hours?

Solution:

Step 1: Recognize knowns:

- Initial amount ($a = 100$) grams
- Half-life ($T_{1/2} = 8$) hours
- Time elapsed ($x = 24$) hours

Step 2: Find the number of half-lives:

$$n = \frac{x}{T_{1/2}} = \frac{24}{8} = 3$$

Step 3: Use decay formula:

$$y = a \times \left(\frac{1}{2}\right)^n$$

$$y = 100 \times \left(\frac{1}{2}\right)^3$$

$$y = 100 \times \frac{1}{8}$$

$$y = 12.5 \text{ grams}$$

Answer: After 24 hours, approximately 12.5 grams of the isotope remains.

Problem 4: Asset Depreciation

A car worth \$20,000 depreciates by 15% each year. What is its value after 4 years?

Solution:

Step 1: Recognize knowns:

$$y = a \times (1 - r)^x$$

- Time ($x = 4$)

Step 2: Plug in:

$$y = 20000 \times (1 - 0.15)^4$$

$$y = 20000 \times 0.85^4$$

Step 3: Calculate:

$$0.85^4 \approx 0.522$$

$$y \approx 20000 \times 0.522$$

$$y \approx 10,440$$

Answer: After 4 years, the car's value is approximately \$10,440.

Understanding Exponential Functions in Word Problems

Before delving into specific examples, it's important to understand what exponential functions are and how they are typically represented in word problems. An exponential function generally has the form:

$$y = a \times b^x$$

where:

- a is the initial amount (or the starting value),
- b is the base, which determines the growth ($b > 1$) or decay ($0 < b < 1$),
- x is the independent variable, often representing time or some other factor.

In word problems, these parameters are often embedded within a narrative that describes real-world phenomena. The challenge lies in translating the language into the mathematical model, solving for unknowns, and interpreting the results.

Common Types of Exponential Word Problems

Exponential problems can generally be categorized based on their context and what is being asked. Here, we'll explore the most common types:

1. Population Growth and Decay

These problems involve populations increasing or decreasing exponentially over time due to factors like reproduction rates or decay processes.

2. Financial Applications

Problems involving compound interest, investments, loans, and depreciation.

3. Radioactive Decay and Half-Life

Modeling the decay of radioactive substances, where the amount halves over specific periods.

4. Bacterial Growth and Medical Dosage

Modeling how bacteria multiply or how medication concentration diminishes in the body.

Step-by-Step Approach to Solving Exponential Word Problems

- Read Carefully and Identify Key Information

Extract the initial value, rate of growth/decay, time period, and what is being asked.

- Translate the Word Problem into a Mathematical Model

Write the exponential function, determine the base (b) , and set up equations accordingly.

- Solve for the Unknown Variable

Use logarithms if needed, especially when solving for time or rate.

- Interpret the Result in Context

Make sure the answer makes sense within the real-world scenario.

Sample Problems with Solutions

Below are detailed examples of exponential word problems with solutions to illustrate the application process.

Problem 1: Population Growth

The population of a certain city is currently 500,000. If the population grows at an annual rate of 3%, what will the population be in 10 years?

Solution:

- Initial population $(P_0 = 500,000)$
- Growth rate $(r = 3\% = 0.03)$
- Time $(t = 10)$ years

The exponential growth model:

$$P = P_0 \times (1 + r)^t$$

Calculating:

$$P = 500,000 \times (1 + 0.03)^{10}$$

$$P = 500,000 \times (1.03)^{10}$$

$$P \approx 500,000 \times 1.3439$$

$$P \approx 672,000$$

Answer: The population in 10 years will be approximately 672,000.

Problem 2: Radioactive Decay

A sample of a radioactive isotope has an initial mass of 100 grams. If its half-life is 8 hours, how much of the isotope remains after 24 hours?

Solution:

- Initial amount ($A_0 = 100$) grams
- Half-life ($T_{1/2} = 8$) hours
- Time elapsed ($t = 24$) hours

Number of half-lives:

$$n = \frac{t}{T_{1/2}} = \frac{24}{8} = 3$$

Remaining amount:

$$A = A_0 \times \left(\frac{1}{2}\right)^n$$

$$A = 100 \times \left(\frac{1}{2}\right)^3$$

$$A = 100 \times \frac{1}{8} = 12.5$$

Answer: After 24 hours, approximately 12.5 grams of the isotope remain.

Problem 3: Compound Interest

An investment of \$10,000 is made into an account with an annual interest rate of 5%, compounded yearly. How much will the investment be worth after 15 years?

Solution:

- Principal $(P = \$10,000)$
- Rate $(r = 5\% = 0.05)$
- Time $(t = 15)$ years

The compound interest formula:

$$A = P \times (1 + r)^t$$

Calculating:

$$A = 10,000 \times (1 + 0.05)^{15}$$

$$A = 10,000 \times (1.05)^{15}$$

$$A \approx 10,000 \times 2.0789$$

$$A \approx 20,789$$

Answer: The investment will grow to approximately \$20,789 after 15 years.

Advanced Word Problems and Applications

For those seeking more challenging problems, here are examples involving logarithms and more complex scenarios.

Problem 4: Decay Rate from Data

A certain bacteria population decreases from 10,000 to 2,500 in 6 hours. Assuming exponential decay, what is the decay rate per hour?

Solution:

- Initial population $(P_0 = 10,000)$
- Final population $(P = 2,500)$

- Time $(t = 6)$

Model:

$$P = P_0 \times b^t$$

Solve for (b) :

$$2,500 = 10,000 \times b^6$$

$$b^6 = \frac{2,500}{10,000} = 0.25$$

$$b = (0.25)^{1/6}$$

Calculate:

$$b \approx (0.25)^{0.1667}$$

$$b \approx e^{0.1667 \times \ln(0.25)}$$

$$\ln(0.25) \approx -1.3863$$

$$b \approx e^{0.1667 \times (-1.3863)}$$

$$b \approx e^{-0.231}$$

$$b \approx 0.794$$

Decay rate per hour:

$$r = 1 - b = 1 - 0.794 = 0.206 \text{ or } 20.6\% \text{ per hour}$$

Answer: The bacteria decay at approximately 20.6% per hour.

Regular practice, a clear problem-solving strategy, and an understanding of the underlying concepts are key to excelling in this area. As you continue to explore exponential problems, remember that each challenge enhances your ability to interpret, model, and solve problems that are fundamental to many scientific and financial fields.

QuestionAnswer How do you solve a word problem involving exponential growth, such as a population doubling every 5 years? Identify the initial amount and the growth rate; then use the exponential growth formula $P(t) = P_0 (2)^{(t / \text{doubling_time})}$. Substitute the given values to find the population at a specific time. What is the key to setting up an exponential decay word problem, like radioactive decay? Determine the initial amount and decay rate, then apply the exponential decay formula $A(t) = A_0 e^{(-kt)}$. Use the given decay information to find the decay constant k and solve for the desired time. How can I model an investment that earns compound interest annually using an exponential function? Use the compound interest formula $A = P(1 + r/n)^{(nt)}$, which is exponential in

nature. For annual compounding, $n=1$, so the formula simplifies to $A = P(1 + r)^t$. Plug in the principal, rate, and time to find the future value. In a word problem, if a bacteria culture starts with 100 bacteria and doubles every 3 hours, how many bacteria will there be after 15 hours? Use the exponential growth formula: $P(t) = P_0 2^{(t / \text{doubling_time})}$. Here, $P_0=100$, $t=15$, $\text{doubling_time}=3$. So, $P(15) = 100 2^{(15/3)} = 100 2^5 = 100 \cdot 32 = 3200$ bacteria. What steps should I follow to solve a real-world problem involving exponential decay, like medication dosage decreasing over time? First, identify the initial dosage and the decay rate or half-life. Set up the exponential decay formula $A(t) = A_0 e^{(-kt)}$ or using half-life. Substitute the known values and solve for the unknown time or amount.

Sample Questions and Their Analytical Breakdown

Example 1: Simple Interest Calculation

Question:

If you deposit \$2,000 into a savings account with an annual simple interest rate of 3%, how much interest will you earn after 4 years?

Answer:

$$\text{Interest} = \text{Principal} \times \text{Rate} \times \text{Time}$$

$$\text{Interest} = \$2,000 \times 0.03 \times 4 = \$240$$

Analysis:

This question tests the student's understanding of the simple interest formula. The straightforward calculation reinforces the importance of understanding rate, time, and principal relationships in financial planning.

Example 2: Compound Interest Scenario

Question:

A \$1,500 investment earns 5% annual interest compounded quarterly. What will be the value of the investment after 3 years?

Answer:

$$\text{Future Value} = \text{Principal} \times (1 + r/n)^{(n \times t)}$$

Where:

$$r = \text{annual interest rate} = 0.05$$

$$n = \text{number of compounding periods per year} = 4$$

$$t = \text{years} = 3$$

Calculation:

$$FV = \$1,500 \times (1 + 0.05/4)^{(4 \times 3)}$$

$$FV = \$1,500 \times (1 + 0.0125)^{12}$$

$$FV = \$1,500 \times (1.0125)^{12} = \$1,500 \times 1.1616 = \$1,742.40$$

Analysis:

This problem introduces students to compound interest and the effect of compounding frequency. Understanding this concept is crucial for evaluating investment growth and loan costs.

Importance of Accurate and Detailed Answer Explanations

Apex Learning's strength lies in its detailed answer explanations, which serve several educational purposes:

For example, in interest calculation questions, answers often include a step-by-step breakdown, formula derivation, and contextual interpretation. This comprehensive explanation fosters deeper understanding and retention.

Sample Explanation for Compound Interest Calculation:

The key to understanding compound interest is recognizing that each period's interest is calculated on the accumulated amount from previous periods. Here, quarterly compounding means the interest rate per quarter is 1.25%. By raising $(1 + 0.0125)$ to the power of 12 (quarters over 3 years), we account for the effect of compounding frequency. The resulting future value reflects how your investment grows faster with more frequent compounding.
