Problem 1: Analyzing a Company's Liquidity

A company's balance sheet shows current assets of \$500,000 and current liabilities of \$250,000.

Solution:

Calculate the current ratio:

$$\text{Current Ratio} = \text{Current Assets} / \text{Current Liabilities} = \$500,000 / \$250,000 = 2.0$$

Interpretation:

A current ratio of 2.0 indicates good short-term liquidity, suggesting the company can comfortably meet its short-term obligations.

Problem 2: Choosing Inventory Valuation Method

Scenario:

A company with rising inventory costs needs to decide between FIFO and LIFO.

Solution:

- FIFO (First-In, First-Out) results in lower cost of goods sold and higher net income during inflation, but higher taxes.
- LIFO (Last-In, First-Out) aligns with current costs, reducing taxable income and income taxes but may understate inventory value.

Strategic Advice:

Select FIFO if the focus is on showing higher profits; choose LIFO for tax advantages during inflation periods.

Problem 3: Recording Depreciation

Scenario:

A machine costing \$100,000 with an estimated useful life of 10 years and salvage value of \$10,000.

Solution:

Straight-line depreciation per year:

$$(\text{Cost} - \text{Salvage Value}) / \text{Useful Life} = (\$100,000 - \$10,000) / 10 = \$9,000$$

Application:

Record \$9,000 as depreciation expense annually for 10 years, reducing the book value of the asset accordingly.

Common Problems and How to Solve Them: MBA Solutions for Module 22

Problem 1: Analyzing Financial Ratios for Decision-Making

Scenario: You are provided with financial statements of a company and asked to assess its liquidity and profitability.

Solution Approach:

- Calculate relevant ratios: current ratio, quick ratio, return on assets (ROA), return on equity (ROE)
- Interpret ratios in context: compare with industry benchmarks
- Identify areas of concern or strength
- Provide strategic recommendations based on analysis

Example:

Ratio	Calculation	Interpretation
Current Ratio	Current Assets / Current Liabilities	Indicates liquidity position
ROE	Net Income / Shareholders' Equity	Measures profitability for shareholders

Tip: Use trend analysis over multiple periods to identify improvements or deteriorations.

Problem 2: Calculating Break-Even Point in Units and Dollars

Scenario: Determine the sales volume required to cover all fixed and variable costs.

Solution Steps:

- Identify fixed costs (FC)
- Determine variable cost per unit (VCU)
- Find contribution margin per unit (CMU) = Selling Price per unit (SP) - VCU
- Calculate break-even point in units:

$$\text{Break-even units} = \frac{\text{FC}}{\text{CMU}}$$

- Calculate break-even sales in dollars:

$$\text{Break-even sales} = \text{Break-even units} \times \text{Selling Price per unit (SP)}$$

$$\text{Break-even sales} = \text{Break-even units} \times \text{SP}$$

]

Example:

$$\text{If FC} = \$50,000, \text{VCU} = \$20, \text{SP} = \$50$$

[

$$\text{CMU} = 50 - 20 = 30$$

]

[

$$\text{Break-even units} = 50,000 / 30 \approx 1667 \text{ units}$$

]

[

$$\text{Break-even sales} = 1667 \times 50 = \$83,350$$

]

Problem 3: Evaluating Investment Projects Using NPV and IRR

Scenario: An organization is considering a project with initial investment, expected cash flows, and a required rate of return.

Solution Approach:

- Calculate the Present Value (PV) of future cash flows discounted at the required rate
- Determine NPV:

[

$$\text{NPV} = \sum_{t=1}^n \frac{\text{CF}_t}{(1 + r)^t} - \text{Initial Investment}$$

\]

- Find IRR: the discount rate at which $NPV = 0$

Decision Rules:

- Accept the project if $NPV > 0$
- Accept if $IRR > \text{required rate of return}$

Example:

Initial Investment = \$100,000

Cash flows over 3 years: \$40,000, \$50,000, \$60,000

Required rate = 10%

Calculate NPV and IRR to decide.
