Sample Questions and Detailed Answers for Diagnostic Test Topic 12

To illustrate how to approach and solve questions in this topic, here are some sample problems with comprehensive solutions.

Question 1: Atomic Structure

What is the electron configuration of an oxygen atom, and how does it relate to its chemical properties?

Answer:

The atomic number of oxygen is 8, indicating 8 electrons. Its electron configuration is:

$1s^2 2s^2 2p^2$

This configuration shows that oxygen has six electrons in its outermost shell ($2s^2 2p^2$). Because it has six valence electrons, oxygen tends to gain two electrons to complete its octet, making it highly electronegative and capable of forming two covalent bonds. This property explains its reactivity,

especially in forming oxides and participating in oxidation-reduction reactions.

Question 2: Chemical Bonding

Describe the shape of a methane molecule (CH_4) based on VSEPR theory.

Answer:

Methane (CH_4) has a central carbon atom bonded to four hydrogen atoms. According to VSEPR (Valence Shell Electron Pair Repulsion) theory:

- The carbon atom has four bonding pairs and no lone pairs.
- These four electron pairs repel each other equally.

This results in a tetrahedral molecular geometry with bond angles approximately 109.5° . Therefore, methane's shape is tetrahedral, which contributes to its symmetry and non-polar nature.

Question 3: Stoichiometry

Calculate the volume of hydrogen gas produced at standard temperature and pressure (STP) when 2 grams of zinc reacts with hydrochloric acid.

Answer:

The balanced chemical equation:

- Molar mass of Zn = 65.38 g/mol
- Moles of Zn = $2 \text{ g} / 65.38 \text{ g/mol} = 0.0306 \text{ mol}$

From the balanced equation, 1 mol of Zn produces 1 mol of H_2 .

- Moles of H_2 = 0.0306 mol

At STP, 1 mol of gas occupies 22.4 liters.

- Volume of H₂ = 0.0306 mol × 22.4 L/mol = 0.6864 liters

Answer: Approximately 0.686 liters (686 mL) of hydrogen gas is produced.
