This guide aims to demystify the core concepts, formulas, and applications related to complex numbers expressed in trigonometric form, providing clarity and confidence whether you're studying for exams, tackling advanced problems, or simply seeking a deeper understanding.

Introduction to Complex Numbers and Their Trigonometric Form

Complex numbers are expressed in the form $a + bi$, where a is the real part and b is the imaginary part. While Cartesian form is intuitive, representing complex numbers as vectors or points on the complex plane, the trig (or polar) form offers a powerful alternative, especially useful for multiplication, division, and exponentiation.

Why Use Trigonometric (Polar) Form?

- Simplifies multiplication and division
- Facilitates raising complex numbers to powers
- Connects complex numbers with geometric interpretations
- Provides a bridge between algebra and trigonometry

Fundamental Concepts and Definitions

- Complex Number in Trigonometric Form

Any non-zero complex number z can be written as:

$$z = r (\cos \theta + i \sin \theta)$$

where:

- $r = |z| = \sqrt{a^2 + b^2}$ the magnitude or modulus of z
- $\theta = \arg(z)$ the argument or angle of z , measured from the positive real axis

- The Unit Circle and the Argument

- The unit circle (radius 1) helps visualize arguments.
- θ is the angle between the positive x-axis and the line representing z .
- Arguments are typically measured in radians ($0 \leq \theta < 2\pi$)

- Euler's Formula

A key bridge between exponential and trigonometric forms:

$$e^{i\theta} = \cos \theta + i \sin \theta$$

This allows us to write complex numbers as:

$$z = r e^{i\theta}$$

which is especially convenient for calculations.

Conversion Between Cartesian and Trigonometric Forms

From Cartesian to Trigonometric

Given $z = a + bi$:

- $r = \sqrt{a^2 + b^2}$
- $\theta = \text{atan2}(b, a)$

Expressed as:

$$z = r (\cos \theta + i \sin \theta)$$

From Trigonometric to Cartesian

Given $z = r (\cos \theta + i \sin \theta)$:

$$- a = r \cos \theta$$

$$- b = r \sin \theta$$

Core Formulas and Theorems

- De Moivre's Theorem

$$(\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta$$

- Critical for raising complex numbers to integer powers.
- Extends to fractional powers via roots.

- Multiplication and Division

For $z_1 = r_1 (\cos \theta_1 + i \sin \theta_1)$ and $z_2 = r_2 (\cos \theta_2 + i \sin \theta_2)$:

- Multiplication:

$$z_1 z_2 = r_1 r_2 [\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)]$$

- Division:

$$z_1 / z_2 = (r_1 / r_2) [\cos(\theta_1 - \theta_2) + i \sin(\theta_1 - \theta_2)]$$

- Powers and Roots

- Power (n):

$$z^n = r^n [\cos(n\theta) + i \sin(n\theta)]$$

- n-th Roots:

The n roots of z are given by:

$$z_k = r^{1/n} [\cos ((\theta + 2\pi k) / n) + i \sin ((\theta + 2\pi k) / n)], \text{ where } k = 0, 1, \dots, n-1$$

Practical Applications and Tips
