- A) Coulomb
- B) Farad
- C) Ohm
- D) Volt

Answer: B) Farad

Sample Question 2: Short Answer

Q: State and explain Ohm's Law.

Answer: Ohm's Law states that the current flowing through a conductor between two points is directly proportional to the voltage across the two points, provided the temperature remains constant. Mathematically, $V = IR$, where V is voltage, I is current, and R is resistance.

Sample Question 3: Numerical Problem

Sample Question 4: Long Answer

Q: Explain the working principle of a transformer and list its main components.

Answer: A transformer works on the principle of electromagnetic induction. It converts electrical energy from one voltage level to another through mutual induction between two coils (primary and secondary) wound around a common iron core. When an alternating current flows through the primary coil, it creates a changing magnetic flux, which induces a voltage in the secondary coil. The voltage transformation depends on the turns ratio of the coils.
